1.0 INTRODUCTION

This traffic analysis has been conducted to identify and evaluate the potential traffic impacts of the proposed Pacoima Spreading Grounds Improvement project. The proposed project site is located in the City of Los Angeles near the intersection of Paxton Street and Arleta Avenue on the west side of the Pacoima Diversion Channel. The project site is generally bounded by Filmore Street to the southeast, Woodman Avenue to the west, San Jose Street to the north, and Arleta Avenue to the northeast and is bisected by Devonshire Street. In addition, a portion of the project site is located north of Paxton Street and east of Arleta Avenue. The project site location and general vicinity are shown in ***Figure 1–1***.

As all of the study intersections are located within the City of Los Angeles, the traffic analysis follows City of Los Angeles traffic study guidelines[1] and is consistent with traffic impact assessment guidelines set forth in the Los Angeles County Congestion Management Program[2]. This traffic analysis evaluates potential project-related impacts at 56 study intersections in the vicinity of the project which are all under either City of Los Angeles jurisdiction only or City of Los Angeles/State of California joint jurisdiction. Six mainline freeway segments are also analyzed using methodology employed by the State of California Department of Transportation (Caltrans). The study intersections were determined in consultation with Los Angeles County Department of Public Works (LACDPW) Traffic and Lighting Division staff and confirmed for analysis purposes with the City of Los Angeles Department of Transportation (LADOT). It should be noted that the governing board of the Los Angeles County Flood Control District (LACFCD) is the County Board of Supervisors and the County is the Lead Agency for purposes of adopting the environmental documentation as required under California Environmental Quality Act (CEQA). However, since all study intersections are located within the City of Los Angeles, the study intersections were appropriately analyzed using LADOT methodology and analysis criteria. In addition, a review was conducted of Los Angeles County Metropolitan Transportation Authority freeway and intersection monitoring stations to determine if a Congestion Management Program transportation impact assessment analysis is required for the proposed project.

This study (i) presents existing traffic volumes, (ii) forecasts existing-plus-project traffic volumes, (iii) forecasts future traffic volumes without the project, (iv) forecasts future traffic volumes with the proposed project, (v) determines project-related impacts, and (vi) recommends mitigation measures, as necessary.

1.1 Study Area

Based on consultation with LACFCD staff, LACDPW Traffic & Lighting Division staff, and City of Los Angeles Department of Transportation staff, a total of 56 study intersections and six mainline freeway segments have been identified for evaluation. These study locations provide local access to the study area and define the extent of the boundaries for this traffic impact investigation. Further discussion of the existing street system and study area is provided in Section 4.0 herein.

The general location of the project in relation to the study locations and surrounding street system is presented in *Figure 1–1*. All key intersections located along each of the potential haul routes under consideration are included for evaluation. The Volume-to-Capacity ratio and Level of Service calculations for the study intersections were used to evaluate the potential traffic-related impacts associated with area growth, cumulative projects and the proposed project. It should be noted that additional locations in the project vicinity were not selected for analysis because they are not anticipated to experience significant impacts due to project generated traffic volumes.

2.0 PROJECT DESCRIPTION

2.1 Existing Project Site

The Pacoima Spreading Grounds cover approximately 169 acres in area and include several components, including an intake radial gate, intake canal, 12 spreading basins with a total storage capacity of 530-acre feet, maintenance roads, spillways and the overflow weir. The proposed project site is located in the City of Los Angeles near the intersection of Paxton Street and Arleta Avenue on the west side of the Pacoima Diversion Channel. The project site is generally bounded by Filmore Street to the southeast, Woodman Avenue to the west, San Jose Street to the north, and Arleta Avenue to the northeast and is bisected by Devonshire Street. In addition, a portion of the project site is located north of Paxton Street and east of Arleta Avenue.

The Pacoima Spreading Grounds, built in the 1930's, is one of the major water conservation facilities that provides groundwater recharge for the San Fernando Valley. The spreading grounds' percolation rate is currently reduced due to a low permeability clay layer underlying the infiltration basins. Currently, water is diverted from the Pacoima Diversion Channel using the radial gate located at the northeast end of the proposed project site. The water then flows through the intake canal, passing through pipes under Arleta Avenue to the spreading basins, where the water percolates to the groundwater basin. During high stormwater flows, the radial gate is lifted out of the channel slightly to allow excess flows to undershoot the gate and travel down the Pacoima Diversion Channel. Although the end of the spreading basins has an overflow structure, the spreading grounds are not intended to be used to run excess flows through the spreading grounds. Flow will travel over the overflow weir only as emergency protection.

2.2 Proposed Project Description

The principle objective of the proposed project is to increase groundwater recharge of the San Fernando Groundwater Basin by increasing the facility's storage capacity and restoring its percolation rate through excavation and reconfiguration of the spreading basins. These actions are aimed to enhance the capabilities of the Pacoima Spreading Grounds as a water conservation facility for the County and City of Los Angeles. The improvements proposed will increase the spreading grounds' capacity and percolation rate and simplify operations by combining basins and constructing new interbasin structures. With completion of the project, the groundwater recharge in the San Fernando Groundwater Basin will be increased. The percolation rate is expected to increase from 65 cubic feet per second (cfs) to 142 cfs through removal of the existing clay layers underlying the spreading basins. The capacity of the spreading basins is expected to increase from 530 acre-feet to 1,197 acre-feet by combining and deepening the existing 12 spreading basins into eight spreading basins.

Approximately 1.6 million cubic yards (cy) of sediment will be excavated in order to completely remove the underlying clay layers; however, only 1.37 million cy of sediment will be exported from the site. The remainder of suitable sediment will be used to backfill the existing intake channel or be returned to the spreading basins to bring the basin inverts up to their finished elevation.

The proposed project includes the transportation and placement of excavated material at facilities prepared and designated to accept such material. A total of four sediment disposal sites have been identified for consideration, either individually or in combination: Sunshine Canyon Landfill, Boulevard Pit, Sheldon Pit, and the Cal-Mat Pit. The Sunshine Canyon landfill is located approximately seven miles (driving distance) northwest of the Pacoima Spreading Grounds. The Boulevard Pit, Sheldon Pit, and Cal-Mat Pit (all operated by Vulcan Materials) are located in the Sun Valley area of Los Angeles, approximately four to five miles (driving distance) southeast of the Pacoima Spreading Grounds.

It should be noted that in the prior evaluation of potential significant traffic impacts associated with the Pacoima Spreading Grounds project, the Sunshine Canyon Landfill was not identified as a potential disposal site. Therefore, the prior traffic impact analysis assumed up to a maximum of 5,000 tons per day of sediment could be exported to the Vulcan Materials site/s via a combination of two previously identified haul routes (i.e., Haul Route A and Haul Route B). Based on input provided during the Pacoima Spreading Grounds Improvement Project's Initial Study review process, LA County proposes to add the Sunshine Canyon Landfill as an additional disposal site in an effort to reduce the daily tonnage being exported to the Vulcan Material site/s. In addition, Haul Route A has been modified in response to comments provided by the community. Therefore, three haul routes from the Pacoima Spreading Grounds site to the sediment disposal site/s have been identified, as follows:

- <u>Modified Haul Route A</u>
  Loaded Trucks – Traveling eastbound on Devonshire Street adjacent to the PSG site, northbound on Arleta Avenue, northeast on Paxton Street to access the I-5 Freeway Southbound, then either exiting the freeway at Sheldon Street heading northwest on Laurel Canyon Boulevard and northeast on Branford Street to access the Boulevard Pit, or exiting the freeway at Penrose Street heading southwest on Penrose Street, northwest on San Fernando Road (E), northeast on Tuxford Street, northwest on Glenoaks Boulevard to access the Cal-Mat Pit, or continuing on Glenoaks Boulevard making a right-turn on Sheldon Street to access the Sheldon Pit.

  Empty Trucks – Either traveling northeast on Branford Street from the Boulevard Pit then northwest on Glenoaks Boulevard, or traveling northwest on Glenoaks Boulevard from the Cal-Mat Pit, or traveling southwest on Sheldon Street from the Sheldon Pit then northwest on Glenoaks Boulevard, then northeast on Osborne Street and Foothill Boulevard to access the I-210 Freeway Westbound and SR-118 Freeway Westbound, exiting the SR-118 Freeway at San Fernando Road, making a right-turn on Paxton Street heading southwest along Paxton Street, southbound on Arleta Avenue and then westbound on Devonshire Street.

- <u>Haul Route B</u>
  Loaded Trucks – Traveling eastbound on Devonshire Street adjacent to the PSG site, northbound on Arleta Avenue, northeast on Paxton Street to access San Fernando Road, then traveling southeast on San Fernando Road to either turn southwest (right) on Branford Street to access the Boulevard Pit, or turn northeast (left) on Branford Street,

then southeast (right) on Glenoaks Boulevard, and northeast (left) on Sheldon Street to access the Sheldon Pit and/or the Cal-Mat Pit.

Empty Trucks – Either traveling northeast on Branford Street from the Boulevard Pit to access San Fernando Road, or traveling northwest on Glenoaks Boulevard from the Cal-Mat Pit then southwest on Branford Street to access San Fernando Road, or traveling southwest on Sheldon Street from the Sheldon Pit then northwest on Glenoaks Boulevard then southwest on Branford to access San Fernando Road. From there, head northwest along San Fernando Road, southwest on Paxton Street, southbound on Arleta Avenue and then westbound on Devonshire Street.

- Haul Route C
  Loaded Trucks – Traveling westbound on Devonshire Street to access the I-405 Freeway Northbound and I-5 Freeway Northbound, exiting the I-5 Freeway at Roxford Street, then head southwest on Roxford Street, northwest on Sepulveda Boulevard, northwest on San Fernando Road, and turn left on Sunshine Canyon Road to access the Sunshine Canyon Landfill.

  Empty Trucks – From Sunshine Canyon Road, turn right (southeast) on San Fernando Road, right (southeast) on Sepulveda Boulevard, then left (northeast) on Roxford Street to access the I-5 Freeway Southbound and I-405 Freeway Southbound. From I-405 Southbound, exit Devonshire Street and turn left (heading eastbound).

Up to 2,800 tons per day (approximately 1,867 cy per day) of sediment will be exported to the Vulcan Materials site/s via a combination of Modified Haul Route A and Haul Route B. Up to 2,200 tons per day (approximately 1,467 cy per day) of sediment will be exported to the Sunshine Canyon Landfill site via Haul Route C. In order to minimize potential impacts to the surrounding street system during the morning commute peak hours, the hauling operation is proposed to begin at 9:00 AM and end at 5:30 PM, Mondays through Fridays with a 30-minute lunch break. The hauling operation associated with the project is anticipated to last approximately 20 months.

So as to identify all potential temporary traffic impacts associated with the use of these disposal sites as part of the environmental documentation, a total of four (4) alternative analyses have been prepared and are summarized below:

- Alternative 1: Concurrent Use of All Three Vulcan Materials Disposal Sites (Boulevard Pit, Sheldon Pit, and the Cal-Mat Pit) and Sunshine Canyon Landfill

- Alternative 2: Use of Boulevard Pit Only and Sunshine Canyon Landfill

- Alternative 3: Use of Sheldon Pit Only and Sunshine Canyon Landfill

- Alternative 4: Use of Cal-Mat Pit Only and Sunshine Canyon Landfill

Any combination of the use of only two of the three Vulcan Materials disposal sites (e.g., concurrent use of only the Boulevard and Sheldon Pits) would have the same or less potential temporary traffic impacts than those identified under either Alternative 2 or Alternative 3. Therefore, since all combinations of two of the three disposal sites would have the same or less traffic impacts than those identified under either Alternative 2 or Alternative 3 (i.e., the two alternatives each with one significant temporary traffic impact to/from the Vulcan Materials disposal sites), all potential traffic impacts have been covered for environmental review purposes.

3.0 SITE ACCESS AND CIRCULATION

The proposed site access scheme and Modified Haul Route A and Haul Route B for the project is displayed in ***Figures 3-1***, ***3-2, 3-3*** and ***3-4*** for Alternatives 1, 2, 3, and 4, respectively. The proposed site access scheme and the Sunshine Canyon haul route (Haul Route C) is displayed in ***Figure 3-5***. It should be noted that the same Haul Route C will be utilized in conjunction with Alternatives 1, 2, 3, and 4. Descriptions of the existing and proposed site access and circulation schemes are provided in the following subsections.

3.1 Existing Site Access

Main vehicular access to and from the Pacoima Spreading Grounds site is provided via Devonshire Street. For the Vulcan Materials disposal sites, all trucks will therefore utilize the Devonshire Street access point to traverse to and from Paxton Street and the I-5 Freeway and/or San Fernando Road in order to deliver sediment material to each of the Vulcan Materials disposal sites. For the Sunshine Canyon Landfill site, trucks will utilize the Devonshire Street access point to traverse to and from the I-405 Freeway and I-5 Freeway in order to deliver sediment material to Sunshine Canyon Landfill.

3.2 Proposed Project Site Access

Vehicular access to the following four disposal sites is as follows:

- Boulevard Pit – Access to the Boulevard Pit, which is operated by Vulcan materials, will be provided via the entry/exit driveway on Branford Street. This access point is located on Branford Street between Laurel Canyon Boulevard and San Fernando Road. Full access (right-turn and left-turn ingress and egress movements) is provided at the Boulevard Pit access driveway.

- Sheldon Pit – Access to the Sheldon Pit, which is also operated by Vulcan materials, is assumed to be provided via the entry/exit driveway on Wentworth Street. This access point is located east of Glenoaks Boulevard. Full access is provided, however, the proposed truck haul route reflects left-turn (eastbound) entry and right-turn (southbound) exit traffic movements only.

- Cal-Mat Pit – Access to the Cal-Mat Pit, which is also operated by Vulcan materials, will be provided via the entry driveway on Wentworth Street. This access point is located east of Glenoaks Boulevard. Full access is provided, however, the proposed truck haul route reflects right-turn (eastbound) entry. For exiting, trucks will utilize the Glenoaks Boulevard driveway via a right-turn only (westbound) traffic movement. Therefore, left-turning traffic movements (either entering or exiting) are not anticipated to occur at the Cal-Mat Pit access driveways.

- Sunshine Canyon Landfill – Access to the Sunshine Canyon Landfill will be provided via Sunshine Canyon Road off of San Fernando Road. Full access is provided, however, the proposed truck haul route reflects left-turn (northbound) entry and right-turn (eastbound) exit traffic movements only.

Figure 3-1 illustrates the envisioned haul routes if all three Vulcan Materials sediment disposal sites are used concurrently. *Figure 3-2* illustrates the envisioned haul routes if only the Boulevard Pit sediment disposal site is used. *Figure 3-3* illustrates the envisioned haul routes if only the Sheldon Pit disposal site is used and *Figure 3-4* illustrates the envisioned haul routes if only the Cal-Mat Pit disposal site is used. *Figure 3-5* illustrates the envisioned haul route for the Sunshine Canyon Landfill site which will be utilized in conjunction with Alternatives 1, 2, 3, and 4.

4.0 EXISTING STREET SYSTEM

4.1 Study Intersections

The existing Pacoima Spreading Grounds facility site is located in the City of Los Angeles near the intersection of Paxton Street and Arleta Avenue on the west side of the Pacoima Diversion Channel. The site is generally bounded by Filmore Street to the southeast, Woodman Avenue to the west, San Jose Street to the north, and Arleta Avenue to the northeast and is bisected by Devonshire Street. In addition, a portion of the project site is located north of Paxton Street and east of Arleta Avenue.

The list of 56 study intersections selected for analysis was based on consultation with Los Angeles County Department of Public Works (LACDPW) and City of Los Angeles Department of Transportation (LADOT) staff. The list of study intersections is presented in ***Table 4-1*** and the study locations are shown in *Figure 1-1*. Forty-two of the 56 study intersections are presently controlled by traffic signals. The existing lane configurations and regulatory controls at the 56 study intersections are displayed in ***Figure 4–1*** and descriptions of the existing roadways (e.g., number of travel lanes, median type, and speed limit) are provided in ***Table 4-2***.

4.2 Study Mainline Freeway Segments

The following six study mainline freeway segment locations under Caltrans jurisdiction were identified for analysis in order to determine potential temporary traffic impacts due to the 20-month hauling operation associated with the project:

1. I-5 Freeway south of Roxford Street
2. I-5 Freeway north of Osborne Street
3. I-5 Freeway south of Laurel Canyon Boulevard
4. SR-118 Freeway east of San Fernando Road
5. I-210 Freeway west of Foothill Boulevard
6. I-405 Freeway north of SR-118 Freeway

4.3 Roadway Classifications

Both the County and City of Los Angeles utilize the roadway categories recognized by regional, state and federal transportation agencies. There are four categories in the roadway hierarchy, ranging from freeways with the highest capacity to two-lane undivided roadways with the lowest capacity. The roadway categories are summarized as follows:

- *Freeways* are limited-access and high-speed travel ways included in the state and federal highway systems. Their purpose is to carry regional through-traffic. Access is provided by interchanges with typical spacing of one mile or greater. No local access is provided to adjacent land uses.

Sunshine Canyon Road	Private Roadway	E-W	2	N/A	15
Roxford Street	Avenue I	E-W	3-4 [13]	N/A	35

Notes:
[1] Roadway classifications obtained from the City of Los Angeles' *Mobility Plan 2035, An Element of the General Plan* , adopted January 20, 2016.
[2] Direction of roadways in the project area: N-S - north and south bound; and E-W - east and west bound.
[3] Number of lanes in both directions on the roadway. Variations in number of travel lanes are noted below.
[4] Median type of the road: RMI - Raised Median Island; 2WLT - 2-Way Left-Turn Lane; and N/A-Not Applicable.
[5] Speed limits in miles per hour (MPH). Roadways without signed speed limits were assumed to have a prima facie speed limit of 25 MPH.
[6] Tujunga Avenue provides two lanes north of Penrose Street and three lanes (two northbound lanes and one southbound lane) south of Penrose Street.
[7] Bike lanes are provided in the project vicinity.
[8] Dronfield Avenue provides two lanes north of Osborne Street and four lanes south of Osborne Street.
[9] Balboa Road provides two northbound lanes and one southbound lane at the study location.
[10] Sepulveda Boulevard provides three lanes (two northbound lanes and one southbound lane) south of San Fernando Road, two lanes west of Roxford Street, and six lanes in the vicinity of Devonshire Street.
[11] Encinitas Avenue provides two northbound lanes and one southbound lane at the study location.
[12] Penrose Street provides three lanes (two westbound lanes and one eastbound lane) between San Fernando Road and Bradley Avenue.
[13] Roxford Street provides three lanes (two westbound lanes and one eastbound lane) west of Encinitas Avenue, and four lanes east of Encinitas Avenue.

- *Arterial* roadways are major streets that primarily serve through-traffic and provide access to abutting properties as a secondary function. Arterials are generally designed with two to six travel lanes and their major intersections are signalized. This roadway type is divided into two categories: major and secondary arterials. Major arterials are typically four-or-more lane roadways and serve both local and regional through-traffic. Secondary arterials are typically two-to-four lane streets that service local and commuter traffic.

- *Collector* roadways are streets that provide access and traffic circulation within residential and non-residential (e.g., commercial and industrial) areas. Collector roadways connect local streets to arterials and are typically designed with two through travel lanes (i.e., one through travel lane in each direction) that may accommodate on-street parking. They may also provide access to abutting properties.

- *Local* roadways distribute traffic within a neighborhood, or similar adjacent neighborhoods, and are not intended for use as a through-street or a link between higher capacity facilities such as collector or arterial roadways. Local streets are fronted by residential uses and do not typically serve commercial uses.

4.4 Regional Highway System

Primary regional access is provided by the I-5 (Golden State) Freeway, the SR-118 (Ronald Reagan) Freeway, the I-210 (Foothill) Freeway, and the I-405 (San Diego) Freeway. A brief description of the regional access is provided in the following paragraphs.

I-5 (Golden State) Freeway is a north-south oriented freeway that extends between northern and southern California. The number of mainline travel lanes varies in the study area. South of Roxford Street and north of the I-405 interchange, five mainline travel lanes along with auxiliary lanes are provided in the northbound and southbound directions. South of Paxton Street, seven northbound and six southbound mainline travel lanes are provided. Between Pierce Street and Branford Street, six mainline travel lanes are provided in both directions. South of the SR-170 interchange, four mainline travel lanes are provided in the northbound and southbound directions. Additionally, one carpool (HOV) lane is provided in each direction throughout the study area. Project-generated trucks traveling to the Boulevard, Sheldon, and Cal-Mat Pits are expected to utilize the Southbound I-5 Freeway lanes only, and are expected to utilize the southbound on-ramp at Paxton Street, the southbound off-ramp at Laurel Canyon Boulevard, and the southbound off-ramp at Penrose Street. Project-generated trucks traveling to the Sunshine Canyon Landfill are expected to utilize the southbound on-ramp and northbound off-ramp located at Roxford Street.

SR-118 (Ronald Reagan) Freeway is an east-west oriented freeway which extends easterly from the City of Moorpark through the San Fernando and Simi Valleys to the eastern terminus at the I-210 interchange in Pacoima. In the project vicinity, four eastbound and westbound mainline travel lanes along with auxiliary lanes are provided. Project-generated trucks are expected to access the SR-118 Freeway Westbound lanes only via the I-210 interchange and will utilize the off-ramp located at San Fernando Road.

I-210 (Foothill) Freeway is an east-west oriented freeway which connects the foothill communities of Los Angeles County from the western terminus at the I-5 interchange in Sylmar easterly to San Bernardino County, where it terminates at the I-10 interchange. In the project vicinity, the I-210 Freeway provides four mainline travel lanes in the eastbound and westbound direction. East of the SR-118 interchange, six westbound and five eastbound travel lanes are provided. Project-generated trucks are expected to access the Westbound I-210 Freeway lanes only via the on-ramp located at Foothill Boulevard.

I-405 (San Diego) Freeway is a major north-south oriented freeway which extends from the northerly terminus at the I-5 interchange in northeast Los Angeles to the southerly terminus at the I-5 interchange located in Orange County. The number of mainline travel lanes varies in the study area. North of Devonshire Street, four mainline travel lanes and one carpool (HOV) lane, along with auxiliary lanes, are provided in the northbound and southbound directions. North of San Fernando Mission Road, three mainline travel lanes are provided in each direction. Project-generated trucks are expected to utilize the southbound off-ramp and the northbound on-ramp located at Devonshire Street.

5.0 TRAFFIC COUNTS

Manual vehicle classification counts of turning movements were conducted at each of the 56 study intersections during the weekday morning (AM), mid-day, and afternoon (PM) commuter periods to determine the peak hour traffic volumes. The manual traffic counts were conducted by an independent traffic count subconsultant (i.e., City Traffic Counters) at 14 study intersections in 2014, ten study intersections in 2015, and 32 study intersections in 2016. The manual vehicle classification counts at the study intersections were conducted from 7:00 to 10:00 AM to determine the weekday AM peak commuter hour, from 12:00 PM to 2:00 PM to determine the weekday mid-day peak hour, and from 3:00 to 6:00 PM to determine the weekday PM peak commuter hour. The manual traffic counts were conducted when local schools were in session. Traffic volumes at the study intersections show the morning and afternoon peak periods typically associated with peak commute hours in metropolitan areas such as Los Angeles. It should be noted that the traffic counts have been increased by 1.5% per year to reflect the year 2017 existing conditions.

The weekday AM, mid-day, and PM peak hour manual counts of vehicle movements at the 56 study intersections are summarized in ***Table 5-1***. The existing traffic volumes at the study intersections during these peak hours are shown in ***Figures 5-1***, ***5-2***, and ***5-3***, respectively. Summary data worksheets of the manual vehicle classification turning movement counts at the study intersections are contained in ***Appendix A***.

It should be noted that the vehicle classification counts categorized the following vehicle types; passenger car vehicles, buses, single unit trucks, and semi-tractor trailer trucks. The traffic volumes shown in the figures and used for analysis purposes reflect appropriate adjustments (i.e., passenger car equivalent, or PCE) to account for the presence of truck traffic that travels within the study area. Accordingly, a PCE of 1.0 was used for passenger car vehicles, a PCE of 2.0 was used for buses, single unit trucks, 3-axle trucks, and 4-axle semi-tractor trailer trucks, and a PCE of 3.0 was used for 5-axle or more semi-tractor trailer trucks. The application of passenger car equivalency factors stem from discussions provided in the *Highway Capacity Manual 6th Edition* (Transportation Research Board of the National Academies of Sciences-Engineering-Medicine, 2016) and the *Roundabouts: An Informational Guide* (U.S. Department of Transportation Federal Highway Administration, 2000).

FIGURE 5-3
EXISTING TRAFFIC VOLUMES
WEEKDAY PM PEAK HOUR
PACOIMA SPREADING GROUNDS IMPROVEMENT PROJECT

6.0 TRAFFIC FORECASTING METHODOLOGY

In order to estimate the traffic impact characteristics of the proposed project, a multi-step process has been utilized. The first step is trip generation, which estimates the total arriving and departing traffic volumes on a peak-hour and daily basis. For projects, the traffic generation potential is typically forecast by applying the appropriate vehicle trip generation equations or rates to the project development tabulation.

The second step of the forecasting process is trip distribution, which identifies the origins and destinations of inbound and outbound project traffic volumes. These origins and destinations are typically based on demographics and existing/anticipated travel patterns in the study area.

The third step is traffic assignment, which involves the allocation of project traffic to study area streets and intersections. Traffic assignment is typically based on minimization of travel time, which may or may not involve the shortest route, depending on prevailing operating conditions and travel speeds. Traffic distribution patterns are indicated by general percentage orientation, while traffic assignment allocates specific volume forecasts to individual roadway links and intersections throughout the study area.

With the forecasting process complete and project traffic assignments developed, the impact of the proposed project is isolated by comparing operational (i.e., Level of Service [LOS]) conditions at selected key locations using existing and expected future traffic volumes with and without forecast project traffic. The need for site-specific and/or cumulative local area traffic improvements can then be evaluated and the significance of the project's impacts identified.

6.1 Project Trip Generation

Traffic generation is expressed in vehicle trip ends, defined as one-way vehicular movements, either entering or exiting the generating land use. Trip generation equations and/or rates provided in the ITE *Trip Generation Manual* publication[3] were not utilized to forecast traffic generation for the proposed project, as the ITE document does not contain trip rates for specifically this type of expected construction-related hauling operation. Therefore, the project trip generation forecast was derived based on the development of employee and truck forecasts given the expected hauling capacities as well as the application of passenger car equivalency (PCE) factors, as described more fully below.

Traffic volumes expected to be generated by the proposed Pacoima Spreading Grounds Improvement project were based on coordination with LACFCD staff. The forecast of employee vehicle trips was provided and accounts for the employees at the Pacoima Spreading Grounds facility. Two inbound and two outbound vehicle trips are anticipated during each of the weekday analysis time periods.

[3] *Trip Generation Manual*, Institute of Transportation Engineers, 9th Edition, 2012.

In developing the forecast of truck trip generation several factors were taken into consideration:

- Hours of Hauling Operation
- Capacity of Haul Trucks (14 or 18 cubic yards per truck)
- Application of PCE Factors
- Amount of Anticipated Export

The proposed project hourly outbound (loaded) truck trips during the AM peak hour, Mid-day peak hour, and PM peak hour are summarized in ***Table 6-1***. As shown in *Table 6-1*, transport of sediment material to the Vulcan Materials site/s via Modified Haul Route A and Haul Route B is assumed while the transport of sediment to the Sunshine Canyon Landfill site via Haul Route C is assumed. Utilizing 18 cubic yard haul trucks, an average of eight hourly outbound truck trips via Modified Haul Route A, five hourly outbound truck trips via Haul Route B, and ten hourly outbound truck trips via Haul Route C for a total of 23 hourly outbound truck trips have been determined. Similarly, utilizing 14 cubic yard haul trucks, an average of ten hourly outbound truck trips via Modified Haul Route A, seven hourly outbound truck trips via Haul Route B, and 13 hourly outbound truck trips via Haul Route C for a total of 30 hourly outbound truck trips have been determined.

As noted above, in order to account for the affect that trucks have on overall intersection operations, PCE factors were accounted for in the analysis of potential construction-related traffic impacts. Based on a review of the size of haul trucks expected to be utilized by the County, a PCE factor of 2.5 or 3.0 was incorporated into the traffic analysis (i.e., it is assumed that a single 14 cubic yard haul truck has the same overall affect on traffic operations as 2.5 passenger cars and that a single 18 cubic yard haul truck has the same overall affect on traffic operations as 3.0 passenger cars). This assumption is conservative and accounts for the heavy vehicle type and slower speeds when fully loaded. The traffic generation forecast for the proposed project assuming the use of 18 cubic-yard capacity haul trucks is summarized in ***Table 6-2***. The traffic generation forecast for the proposed project assuming the use of 14 cubic-yard capacity haul trucks is summarized in ***Table 6-3***.

As presented in *Table 6-2*, using haul trucks with 18 cubic yard capacity per truck, the proposed project is expected to generate 142 PCE-adjusted vehicle trips (71 inbound trips and 71 outbound trips) during the weekday AM peak hour, mid-day peak hour, and PM peak hour. The proposed project is expected to generate 1,134 PCE-adjusted daily trip ends during a typical weekday (567 inbound trips and 567 outbound trips), including 18 employee trip ends. This equates to a total of 372 daily haul truck trips, if only 18 cubic yard trucks were used.

As presented in *Table 6-3*, using haul trucks with 14 cubic yard capacity per truck, the proposed project is expected to generate 156 PCE-adjusted vehicle trips (78 inbound trips and 78 outbound trips) during the weekday AM peak hour, mid-day peak hour, and PM peak hour. The proposed project is expected to generate 1,214 PCE-adjusted daily trip ends during a typical weekday (607

Table 6-1
PROPOSED PROJECT PEAK HOURLY OUTBOUND (LOADED) TRUCK TRIPS [1]

TRAFFIC ANALYSIS TIME PERIOD	OUTBOUND TO VULCAN MATERIALS SITE/S		OUTBOUND TO SUNSHINE CANYON LANDFILL	TOTAL
	MODIFIED HAUL ROUTE A	HAUL ROUTE B	HAUL ROUTE C	
Using 18 Cubic-Yard Capacity Trucks				
AM Peak Hour [2]	8	5	10	23
Mid-day Peak Hour [3]	8	5	10	23
PM Peak Hour [4]	8	5	10	23
Using 14 Cubic-Yard Capacity Trucks				
AM Peak Hour [2]	10	7	13	30
Mid-day Peak Hour [3]	10	7	13	30
PM Peak Hour [4]	10	7	13	30

Notes:

[1] Based on coordination with LA County staff, proposed hauling operations will occur Mondays through Fridays, between 9:00 AM and 5:30 PM (i.e., eight-hour days plus half-hour lunch).

[2] Typical weekday morning peak commute period is from 7:00 am to 10:00 am. For project-related traffic generation purposes, the AM Peak Hour reflects the hourly outbound total from 9:00 am to 10:00 am, since the hauling operations are proposed to begin at 9:00 am.

[3] Typical weekday mid-day period is from 10:00 am to 3:00 pm. For project-related traffic generation purposes, the Mid-day Peak Hour reflects the peak hourly outbound total between 10:00 am and approximately 2:30 pm (for approximately four hours during the Mid-day period).

[4] Typical weekday afternoon peak commute period is from 3:00 pm to 6:00 pm. For project-related traffic generation purposes, the PM Peak Hour reflects the peak hourly outbound total between approximately 2:30 pm and 5:30 pm (for approximately three hours during the PM peak period).

Table 6-2
PROJECT TRIP GENERATION USING 18 CUBIC-YARD CAPACITY TRUCKS [1]

LAND USE	DAILY TRIP ENDS [2] VOLUMES	AM PEAK HOUR VOLUMES [2]			MID-DAY PEAK HOUR VOLUMES [2]			PM PEAK HOUR VOLUMES [2]		
		IN	OUT	TOTAL	IN	OUT	TOTAL	IN	OUT	TOTAL

[B] Vulcan: 18-cy Truck Trips (unadjusted) [3]	208	13	13	26	13	13	26	13	13	26
[C] Sunshine Canyon: 18-cy Truck Trips (unadjusted) [4]	164	10	10	20	10	10	20	10	10	20
[D] Vulcan: PCE Adjusted 18-cy Truck Trips [5]	624	39	39	78	39	39	78	39	39	78
[E] Sunshine Canyon: PCE Adjusted 18-cy Truck Trips [5]	492	30	30	60	30	30	60	30	30	60
Net Increase with 18-CY Trucks ([A]+[B]+[C])	**390**	**25**	**25**	**50**	**25**	**25**	**50**	**25**	**25**	**50**
Net PCE Increase with 18-CY Trucks ([A]+[D]+[E])	**1,134**	**71**	**71**	**142**	**71**	**71**	**142**	**71**	**71**	**142**

[1] Source: Based on coordination with LA County representatives and Psomas, the following are assumed:
Total sediment to be exported = 1,370,000 cubic yards (cy), with 1 cy = 1.5 tons
Up to 2,800 tons per day (tpd) will be exported to the Vulcan site/s and up to 2,200 tpd will be exported to the Sunshine Canyon Landfill site.
Hours of Truck Hauling Operations: Mondays to Fridays, 9:00 AM to 5:30 PM (8 hours of hauling per day are assumed)

[2] Trips are one-way traffic movements, entering or leaving.

[3] Daily truck trips to/from the Vulcan site/s were derived based on the following, using 18 cubic yard (cy) capacity per haul truck:
(2,800 tons per day) x (1 cy per 1.5 tons) = 1,867 cy per day / 18 cy per truck = 104 inbound trips + 104 outbound trips = 208 total daily truck trips.
Peak Hour Truck Trips = 104 trips / 8 hours = 13 one-way truck trips per hour.
Thus, for analysis purposes 13 inbound truck trips + 13 outbound truck trips = 26 total truck trips per hour have been assumed.

[4] Daily truck trips to/from the Sunshine Canyon Landfill site were derived based on the following, using 18 cubic yard (cy) capacity per haul truck:
(2,200 tons per day) x (1 cy per 1.5 tons) = 1,467 cy per day / 18 cy per truck = 82 inbound trips + 82 outbound trips = 164 total daily truck trips.
Peak Hour Truck Trips = 82 trips / 8 hours = 10 one-way truck trips per hour.
Thus, for analysis purposes 10 inbound truck trips + 10 outbound truck trips = 20 total truck trips per hour have been assumed.

[5] A passenger car equivalency (PCE) factor of 3.0 was employed for analysis purposes. This accounts for the assumption that a single 18 cubic yard capacity haul truck has the same overall affect on intersection traffic operations as 3.0 passenger cars.

Table 6-3

[B] Vulcan: 14-cy Truck Trips (unadjusted) [3]	268	17	17	34	17	17	34	17	17	34
[C] Sunshine Canyon: 14-cy Truck Trips (unadjusted) [4]	210	13	13	26	13	13	26	13	13	26
[D] Vulcan: PCE Adjusted 14-cy Truck Trips [5]	670	43	43	86	43	43	86	43	43	86
[E] Sunshine Canyon: PCE Adjusted 14-cy Truck Trips [5]	526	33	33	66	33	33	66	33	33	66
Net Increase with 14-CY Trucks ([A]+[B]+[C])	**496**	**32**	**32**	**64**	**32**	**32**	**64**	**32**	**32**	**64**
Net PCE Increase with 14-CY Trucks ([A]+[D]+[E])	**1,214**	**78**	**78**	**156**	**78**	**78**	**156**	**78**	**78**	**156**

[1] Source: Based on coordination with LA County representatives and Psomas, the following are assumed:
Total sediment to be exported = 1,370,000 cubic yards (cy), with 1 cy = 1.5 tons
Up to 2,800 tons per day (tpd) will be exported to the Vulcan site/s and up to 2,200 tpd will be exported to the Sunshine Canyon Landfill site.
Hours of Truck Hauling Operations: Mondays to Fridays, 9:00 AM to 5:30 PM (8 hours of hauling per day are assumed)

[2] Trips are one-way traffic movements, entering or leaving.

[3] Daily truck trips to/from the Vulcan site/s were derived based on the following, using 14 cubic yard (cy) capacity per haul truck:
(2,800 tons per day) x (1 cy per 1.5 tons) = 1,867 cy per day / 14 cy per truck = 134 inbound trips + 134 outbound trips = 268 total daily truck trips.
Peak Hour Truck Trips = 134 trips / 8 hours = 17 one-way truck trips per hour.
Thus, for analysis purposes 17 inbound truck trips + 17 outbound truck trips = 34 total truck trips per hour have been assumed.

[4] Daily truck trips to/from the Sunshine Canyon Landfill site were derived based on the following, using 14 cubic yard (cy) capacity per haul truck:
(2,200 tons per day) x (1 cy per 1.5 tons) = 1,467 cy per day / 14 cy per truck = 105 inbound trips + 105 outbound trips = 210 total daily truck trips.
Peak Hour Truck Trips = 105 trips / 8 hours = 13 one-way truck trips per hour.
Thus, for analysis purposes 13 inbound truck trips + 13 outbound truck trips = 26 total truck trips per hour have been assumed.

[5] A passenger car equivalency (PCE) factor of 2.5 was employed for analysis purposes. This accounts for the assumption that a single 14 cubic yard capacity haul truck has the same overall affect on intersection traffic operations as 2.5 passenger cars.

inbound trips and 607 outbound trips), including 18 employee trip ends. This equates to a total of 478 daily haul truck trips, if only 14 cubic yard trucks were used. In reality, both size trucks will likely be used (i.e., resulting between 372 and 478 total daily truck trips).

By comparison, using haul trucks with 14 cubic yard capacity per truck will provide a slightly higher, more conservative assessment of potential project trip generation. Therefore, this traffic impact analysis utilizes the project trip generation forecasts based on the use of 14 cubic yard haul trucks so as to provide a conservative assessment of potential project-related traffic impacts.

6.2 Project Trip Distribution and Assignment

Project traffic volumes both entering and exiting the Pacoima Spreading Grounds site have been distributed and assigned to the adjacent street system based on the following considerations:

- The Pacoima Spreading Grounds site's proximity to major traffic corridors to and from the Vulcan Materials disposal site/s (i.e., I-5 Freeway, SR-118 Freeway, I-210 Freeway, Laurel Canyon Boulevard, San Fernando Road, Glenoaks Boulevard, Paxton Street, Branford Street, Tuxford Street, etc.);

- The Pacoima Spreading Grounds site's proximity to major traffic corridors to and from the Sunshine Canyon Landfill site (i.e., I-405 Freeway, I-5 Freeway, Devonshire Street, Roxford Street, Sepulveda Boulevard, San Fernando Road, etc.);

- Expected localized traffic flow patterns based on adjacent roadway channelization and presence of traffic signals;

- Existing intersection traffic volumes;

- Ingress/egress availability at each of the sediment disposal sites;

- The proposed haul routes to and from each of the four sediment disposal sites;

- The daily amount of sediment to be exported (i.e., 2,800 tons per day to the Vulcan Materials disposal site/s, 2,200 tons per day to the Sunshine Canyon Landfill site); and

- A generalized distribution of 60% via I-5/SR-118/I-210 Freeways (Modified Haul Route A) and 40% via San Fernando Road (Haul Route B) for the proportion of truck trips to and from the Vulcan Materials disposal site/s.

The PCE-adjusted traffic volumes at the study intersections for the weekday AM, Mid-day and PM peak hours are displayed in ***Figures 6–1***, ***6-2***, ***6-3***, and ***6-4*** for Alternatives 1, 2, 3, and 4, respectively. As discussed earlier in Subsection 2.2 herein, the following alternatives have been fully analyzed for purposes of this traffic analysis:

- Alternative 1: Concurrent Use of All Three Vulcan Materials Sediment Disposal Sites (Boulevard Pit, Sheldon Pit, and the Cal-Mat Pit) and Sunshine Canyon Landfill

FIGURE 6-4
PROJECT TRAFFIC VOLUMES - ALTERNATIVE ROUTE 4
WEEKDAY AM, MID-DAY AND PM PEAK HOUR

PACOIMA SPREADING GROUNDS IMPROVEMENT PROJECT

- Alternative 2: Use of Boulevard Pit Only and Sunshine Canyon Landfill
- Alternative 3: Use of Sheldon Pit Only and Sunshine Canyon Landfill
- Alternative 4: Use of Cal-Mat Pit Only and Sunshine Canyon Landfill

Any combination of the use of only two of the three disposal sites (e.g., concurrent use of only the Boulevard and Sheldon Pits) would have the same or less potential temporary traffic impacts than those identified under either Alternative 2 or Alternative 3. Therefore, since all combinations of two of the three disposal sites would have the same or less traffic impacts than those identified under Alternative 2 and Alternative 3 (i.e., the two Alternatives each with one significant temporary traffic impact to/from the Vulcan Materials disposal sites), all potential traffic impacts have been covered for environmental review purposes.

7.0 FUTURE DEVELOPMENT

The forecast of future conditions was prepared in accordance with procedures outlined in Section 15130 of the California Environmental Quality Act (CEQA) Guidelines. Specifically, the CEQA Guidelines provides two options for developing the future traffic volume forecast:

> "(A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the [lead] agency, or
>
> (B) A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency."

Accordingly, the traffic analysis using the City of Los Angeles methodology provides a highly conservative estimate of future traffic volumes as it incorporates both the "A" and "B" options outlined in CEQA Guidelines for purposes of developing the forecast. This has been confirmed with City staff prior to commencement of the traffic analysis.

7.1 Related Projects

A forecast of on-street traffic conditions was prepared by incorporating the potential trips associated with other known development projects (related projects) in the area. With this information, the potential impact of the proposed project can be evaluated within the context of the cumulative impact of all ongoing development. The related projects research was based on information on file at both the County of Los Angeles Department of Regional Planning and the City of Los Angeles Departments of Planning and Transportation, as well as the LACFCD to determine any projects with overlapping haul routes and schedules. The list of related projects in the project study area is presented in ***Table 7-1***. The location of the related projects is shown in ***Figure 7-1***.

As shown in *Table 7-1*, the Devils Gate Sediment Removal Project and the Lopez Spreading Grounds Improvement Project are included as related projects (Map Nos. 24 and 25, respectively). Other LACFCD projects have been considered but are not included in *Table 7-1* because they either; 1) do not have any haul route overlaps with the proposed project during the weekday conditions, 2) they are forecast to begin only after the completion of the proposed project, or 3) they propose to use conveyor belts only for the transport of materials (i.e., no trucks).

[1] Source: City of Los Angeles Department of Transportation (LADOT), and Los Angeles County Flood Control District (LACFCD), except as noted below. The peak hour traffic volumes were forecast based on trip data provided by LADOT and by applying trip rates as provided in the ITE "Trip Generation Manual", 9th Edition, 2012. For those related projects that LADOT provided trip data, the peak hour directional distribution data provided in the ITE "Trip Generation Manual" were utilized.
[2] Trips are one-way traffic movements, entering or leaving.
[3] ITE Land Use Code 560 (Church) trip generation average rates.
[4] ITE Land Use Code 252 (Senior Adult Housing-Attached) trip generation average rates.
[5] ITE Land Use Code 210 (Single-Family Detached Housing) trip generation average rates.
[6] Daily trip rates were not provided, therefore ITE Land Use Codes 220 (Apartment) and 820 (Shopping Center) trip generation average rates were utilized.
[7] ITE Land Use Code 152 (High-Cube Warehouse/Distribution Center) trip generation average rates.

FIGURE 7-1
LOCATION OF RELATED PROJECTS

PACOIMA SPREADING GROUNDS IMPROVEMENT PROJECT

o:\job_file\4056-4\dwg\f7-1.dwg LDP 11:22:04 03/29/2017 rodriquez

Traffic volumes expected to be generated by the related projects were calculated using rates provided in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*. The related projects' respective traffic generation for the weekday AM peak hour, mid-day peak hour, PM peak hour and weekday daily, is summarized in *Table 7-1*. The traffic analysis accounts for the distribution of the related projects traffic volumes to the study intersections during the weekday AM peak hour, mid-day peak hour, and PM peak hour.

7.2 Ambient Traffic Growth Factor

Horizon year background traffic growth estimates have been calculated using an ambient traffic growth factor. In order to account for area-wide regional growth not included in this analysis in the future condition as well as to increase traffic counts from 2014 through 2016 to 2017 levels, the existing traffic volumes were increased at an annual rate of one and a half percent (1.5%) to the year 2020 (i.e., the anticipated year of project build-out). The ambient growth factor was based on general traffic growth factors provided in the *2010 Congestion Management Program for Los Angeles County* (the "CMP manual") and determined in consultation with LADOT staff. It is noted that based on review of the general traffic growth factors provided in the CMP manual for the project study area (i.e., Regional Statistical Area (RSA) No. 14 – San Fernando, Granada Hills, Sylmar, Tujunga), it is anticipated that the existing traffic volumes are expected to increase at an annual rate of approximately 0.49% per year between the years 2010 and 2020. Thus, application of the 1.5% annual growth factor allows for a conservative, worst case forecast of future traffic volumes in the area. Further, it is noted that the CMP manual's traffic growth rate is intended to anticipate future traffic generated by development projects in the project vicinity. Thus, the inclusion in this traffic analysis of both a forecast of traffic generated by known related projects plus the use of an ambient growth traffic factor based on CMP traffic model data results in a conservative estimate of future traffic volumes at the study intersections.

8.0 TRAFFIC IMPACT ANALYSIS METHODOLOGY

8.1 Intersection Analysis Methodology

All of the 56 study intersections are under either sole City of Los Angeles jurisdiction or joint City of Los Angeles/Caltrans jurisdiction. As such, the study intersections were evaluated using the Critical Movement Analysis (CMA) method of analysis that determines Volume-to-Capacity (*v/c*) ratios on a critical lane basis. The overall intersection *v/c* ratio is subsequently assigned a Level of Service (LOS) value to describe intersection operations. Level of Service varies from LOS A (free flow) to LOS F (jammed condition). A description of the CMA method and corresponding Levels of Service is provided in ***Appendix B***.

In addition, in order to analyze the potential vehicle queuing at the corresponding I-5, SR-118, and I-405 Freeway Off Ramp intersections (which are under joint City of Los Angeles and Caltrans jurisdiction), the methodologies outlined in the *Highway Capacity Manual 6th Edition* have been utilized.

8.2 Intersection Impact Criteria and Thresholds

The relative impact of the added project traffic volumes to be generated by the proposed project during the weekday AM peak hour, Mid-day, and PM peak hour was evaluated based on analysis of existing and future operating conditions at the study intersections, without and with the proposed project. The previously discussed capacity analysis procedures were utilized to evaluate the future *v/c* relationships and service level characteristics at each study intersection.

As all study intersections are under either sole City of Los Angeles jurisdiction or joint City of Los Angeles/Caltrans jurisdiction, the significance of the potential project-generated traffic impacts was identified using criteria set forth in LADOT's *Transportation Impact Study Guidelines*. According to the City of Los Angeles' Sliding Scale Method for calculating the level of impact due to traffic generated by the proposed project, a significant transportation impact is determined based on the sliding scale criteria presented in ***Table 8-1***.

Table 8-1
CITY OF LOS ANGELES
INTERSECTION IMPACT THRESHOLD CRITERIA

Final *v/c*	**Level of Service**	**Project Related Increase in *v/c***
> 0.701 - 0.800	C	equal to or greater than 0.040
> 0.801 - 0.900	D	equal to or greater than 0.020
> 0.901 - 1.000	E	equal to or greater than 0.010
Greater than 1.000	F	equal to or greater than 0.010

The City's Sliding Scale Method requires mitigation of project traffic impacts whenever traffic generated by the proposed development causes an increase in the analyzed intersection *v/c* ratio by an amount equal to or greater than the values shown above.

It should be noted that LADOT's impact criteria and thresholds are typically applied to land use development projects with permanent/recurring increases in project traffic volumes. As discussed previously, the proposed construction-related hauling operations are anticipated to last for approximately 20 months. Once the proposed hauling operations are completed, traffic conditions for the surrounding street system are expected to revert back to the pre-project levels. Thus, applying LADOT's criteria to the proposed project is considered a conservative approach.

8.3 Intersection Traffic Impact Analysis Scenarios

Traffic impacts at the study intersections were analyzed for the following conditions pursuant to City of Los Angeles requirements:

[a] Existing conditions.

[b] Condition [a] with the proposed project.

[c] Condition [a] plus 1.5% annual ambient traffic growth through year 2020 and with completion and occupancy of the related projects (i.e., year 2020 cumulative baseline).

[d] Condition [c] with the proposed project.

[e] Condition [d] with implementation of project mitigation measures, where necessary.

The traffic volumes for each new condition were added to the volumes in the prior condition to determine the change in capacity utilization at the study intersections.

9.0 TRAFFIC ANALYSIS

The traffic impact analysis prepared for the study intersections using the CMA methodology and application of the City of Los Angeles significant traffic impact criteria is summarized in ***Tables 9-1, 9-2, 9-3,*** and ***9-4*** for Alternatives 1, 2, 3, and 4, respectively. The corresponding weekday AM, Mid-day, and PM peak hour CMA data worksheets are contained in ***Appendix C***.

9.1 Existing Conditions

9.1.1 *Existing Conditions*

As indicated in column [1] of *Tables 9-1, 9-2, 9-3,* and *9-4*, 48 of the 56 study intersections are presently operating at LOS D or better during the weekday AM, Mid-day, and PM peak hours under existing conditions. The following eight study intersections are operating at LOS E or LOS F during the weekday AM and/or PM peak hour under existing conditions:

- Int. 15: Laurel Canyon Boulevard/Paxton Street — PM Peak Hour: *v/c*=0.903, LOS E
- Int. 29: Glenoaks Boulevard/Osborne Street — AM Peak Hour: *v/c*=1.032, LOS F
- Int. 47: Balboa Road/San Fernando Road — AM Peak Hour: *v/c*=0.988, LOS E
- Int. 49: I-5 SB Ramps/Roxford St-Sepulveda Blvd — AM Peak Hour: *v/c*=1.015, LOS F
- Int. 50: I-5 NB Off-Ramp/Roxford Street — AM Peak Hour: *v/c*=0.965, LOS E; PM Peak Hour: *v/c*=0.915, LOS E
- Int. 52: I-405 SB Ramps-Blucher Av/Devonshire St — AM Peak Hour: *v/c*=0.912, LOS E
- Int. 54: Sepulveda Boulevard/Devonshire Street — PM Peak Hour: *v/c*=0.944, LOS E
- Int. 56: Woodman Avenue/Devonshire Street — AM Peak Hour: *v/c*=0.986, LOS E

The existing conditions CMA data worksheets for the City of Los Angeles study intersections during the weekday AM, Mid-day, and PM peak hours are contained in *Appendix C*. The existing traffic volumes at the study intersections during the weekday AM, Mid-day, and PM peak hours are displayed in *Figures 5-1*, *5-2*, and *5-3*, respectively.

9.1.2 *Existing With Project Conditions*

As shown in column [2] of *Tables 9-1, 9-2, 9-3,* and *9-4,* application of the City of Los Angeles' threshold criteria to the "Existing With Project" scenario indicates that the proposed project is expected to create significant temporary traffic impacts at the following study intersections during the analysis peak hour(s) shown under Alternatives 1, 2, 3, and 4 conditions:

- Int. 46: San Fernando Road/Sunshine Canyon Road (AM Peak Hour)
- Int. 49: I-5 SB Ramps/Roxford St-Sepulveda Blvd (AM Peak Hour)
- Int. 50: I-5 NB Off-Ramp/Roxford Street (AM and PM Peak Hours)
- Int. 54: Sepulveda Boulevard/Devonshire Street (PM Peak Hour)
- Int. 56: Woodman Avenue/Devonshire Street (AM Peak Hour)

[a] According to LADOT's "Transportation Impact Study Guidelines", December 2016, a transportation impact on an intersection shall be deemed significant in accordance with the following table:

Final v/c	LOS	Project Related Increase in v/c
>0.700 - 0.800	C	equal to or greater than 0.040
>0.800 - 0.900	D	equal to or greater than 0.020
>0.900	E/F	equal to or greater than 0.010

[a] According to LADOT's "Transportation Impact Study Guidelines", December 2016, a transportation impact on an intersection shall be deemed significant in accordance with the following table:

Final v/c	LOS	Project Related Increase in v/c
>0.700 - 0.800	C	equal to or greater than 0.040
>0.800 - 0.900	D	equal to or greater than 0.020
>0.900	E/F	equal to or greater than 0.010

It should be noted that all five study intersections expected to be significantly impacted by the proposed project under the Existing with Project conditions are located along Haul Route C (i.e., to and from the Sunshine Canyon Landfill site). Incremental, but not significant, traffic impacts are noted in column [2] at the remaining 51 study intersections under Alternatives 1, 2, 3, and 4 conditions. Furthermore, no significant traffic impacts are expected at any of the study intersections during the mid-day peak hour conditions. The existing with project traffic volumes at the study intersections for Alternative Routes 1, 2, 3, and 4 during the weekday AM, mid-day, and PM peak hours are provided in ***Appendix C-1***.

9.2 Year 2020 Conditions

9.2.1 *Year 2020 Cumulative Without Project Conditions*

The year 2020 cumulative without project conditions were forecast based on the addition of traffic generated by the completion and occupancy of the related projects, as well as the growth in traffic due to the combined effects of continuing development, intensification of existing developments and other factors (i.e., ambient growth). The *v/c* ratios at the study intersections are incrementally increased with the addition of ambient traffic and traffic generated by the related projects listed in *Table 7-1*. As presented in column [3] of *Tables 9-1, 9-2, 9-3,* and *9-4*, 37 of the 56 study intersections are expected to continue operating at LOS D or better during the weekday AM, Mid-day, and PM peak hours with the addition of growth in ambient traffic and related projects traffic under the Year 2020 cumulative without project conditions. The following 19 study intersections are expected to operate at LOS E or LOS F during the weekday AM and/or PM peak hour with the addition of ambient traffic growth and traffic due to the related projects:

- Int. 5: Laurel Canyon Boulevard/Branford Street — AM Peak Hour: *v/c*=0.932, LOS E
- Int. 6: San Fernando Road/Branford Street — AM Peak Hour: *v/c*=0.907, LOS E
- Int. 7: Laurel Canyon Bl/I-5 NB Off-Ramp-Jerome St — AM Peak Hour: *v/c*=0.903, LOS E
- Int. 8: Laurel Canyon Boulevard/Sheldon Street — AM Peak Hour: *v/c*=0.911, LOS E
- Int. 9: Laurel Canyon Boulevard/I-5 SB Ramps — AM Peak Hour: *v/c*=0.907, LOS E
- Int. 14: Glenoaks Boulevard/Sheldon Street — AM Peak Hour: *v/c*=0.931, LOS E
- Int. 15: Laurel Canyon Boulevard/Paxton Street — PM Peak Hour: *v/c*=0.967, LOS E
- Int. 19: San Fernando Road/Paxton Street — AM Peak Hour: *v/c*=0.949, LOS E; PM Peak Hour: *v/c*=0.915, LOS E
- Int. 21: San Fernando Road/Van Nuys Boulevard — AM Peak Hour: *v/c*=0.916, LOS E
- Int. 22: San Fernando Road/Pierce Street — AM Peak Hour: *v/c*=0.938, LOS E
- Int. 24: San Fernando Road/Osborne Street — AM Peak Hour: *v/c*=0.940, LOS E; PM Peak Hour: *v/c*=0.931, LOS E
- Int. 26: Arleta Avenue/Van Nuys Boulevard — AM Peak Hour: *v/c*=0.972, LOS E; PM Peak Hour: *v/c*=0.963, LOS E

- Int. 29: Glenoaks Boulevard/Osborne Street — AM Peak Hour: *v/c*=1.200, LOS F; PM Peak Hour: *v/c*=0.971, LOS E
- Int. 47: Balboa Road/San Fernando Road — AM Peak Hour: *v/c*=1.045, LOS F
- Int. 49: I-5 SB Ramps/Roxford St-Sepulveda Blvd — AM Peak Hour: *v/c*=1.118, LOS F
- Int. 50: I-5 NB Off-Ramp/Roxford Street — AM Peak Hour: *v/c*=1.053, LOS F; PM Peak Hour: *v/c*=1.012, LOS F
- Int. 52: I-405 SB Ramps-Blucher Ave/Devonshire St — AM Peak Hour: *v/c*=0.969, LOS E
- Int. 54: Sepulveda Boulevard/Devonshire Street — AM Peak Hour: *v/c*=0.960, LOS E; PM Peak Hour: *v/c*=1.026, LOS F
- Int. 56: Woodman Avenue/Devonshire Street — AM Peak Hour: *v/c*=1.051, LOS F

The Year 2020 cumulative without project (existing, ambient growth, and related projects) traffic volumes at the study intersections are shown in ***Appendix C-2***.

9.2.2 *Year 2020 Cumulative With Project Conditions*

As shown in column [4] of *Tables 9-1, 9-2, 9-3,* and *9-4,* application of the City of Los Angeles' threshold criteria to the "Year 2020 With Project" scenario indicates that the proposed project is expected to create significant temporary traffic impacts at five study intersections under Alternative Route 1, six study intersections under Alternative Route 2, six study intersections under Alternative Route 3, and five study intersections under Alternative Route 4, as follows:

Alternative Route 1: Concurrent Use of All Three Vulcan Materials Disposal Sites (Boulevard Pit, Sheldon Pit, and the Cal-Mat Pit) and Sunshine Canyon Landfill

- Int. 46: San Fernando Road/Sunshine Canyon Road (AM Peak Hour)
- Int. 49: I-5 SB Ramps/Roxford St-Sepulveda Blvd (AM and PM Peak Hours)
- Int. 50: I-5 NB Off-Ramp/Roxford Street (AM and PM Peak Hours)
- Int. 54: Sepulveda Boulevard/Devonshire Street (AM and PM Peak Hours)
- Int. 56: Woodman Avenue/Devonshire Street (AM Peak Hour)

Alternative Route 2: Use of Boulevard Pit Only and Sunshine Canyon Landfill

- Int. 6: San Fernando Road/Branford Street (AM peak hour)
- Int. 46: San Fernando Road/Sunshine Canyon Road (AM Peak Hour)
- Int. 49: I-5 SB Ramps/Roxford St-Sepulveda Blvd (AM and PM Peak Hours)
- Int. 50: I-5 NB Off-Ramp/Roxford Street (AM and PM Peak Hours)
- Int. 54: Sepulveda Boulevard/Devonshire Street (AM and PM Peak Hours)
- Int. 56: Woodman Avenue/Devonshire Street (AM Peak Hour)

Alternative Route 3: Use of Sheldon Pit Only and Sunshine Canyon Landfill

- Int. 14: Glenoaks Boulevard/Sheldon Street (AM peak hour)
- Int. 46: San Fernando Road/Sunshine Canyon Road (AM Peak Hour)
- Int. 49: I-5 SB Ramps/Roxford St-Sepulveda Blvd (AM and PM Peak Hours)
- Int. 50: I-5 NB Off-Ramp/Roxford Street (AM and PM Peak Hours)
- Int. 54: Sepulveda Boulevard/Devonshire Street (AM and PM Peak Hours)
- Int. 56: Woodman Avenue/Devonshire Street (AM Peak Hour)

Alternative Route 4: Use of Cal-Mat Pit Only and Sunshine Canyon Landfill

- Int. 46: San Fernando Road/Sunshine Canyon Road (AM Peak Hour)
- Int. 49: I-5 SB Ramps/Roxford St-Sepulveda Blvd (AM and PM Peak Hours)
- Int. 50: I-5 NB Off-Ramp/Roxford Street (AM and PM Peak Hours)
- Int. 54: Sepulveda Boulevard/Devonshire Street (AM and PM Peak Hours)
- Int. 56: Woodman Avenue/Devonshire Street (AM Peak Hour)

It should be noted that five of the study intersections expected to be significantly impacted by the proposed project under the Year 2020 with Project conditions are located along Haul Route C (i.e., to and from the Sunshine Canyon Landfill site). Since Haul Route C is proposed to be utilized in conjunction with any of the four alternative routes, the same level of significant temporary traffic impacts are expected at these five study intersections under any of the alternative route conditions. In addition, one study intersection under the Alternative Route 2 condition (to and from the Boulevard Pit) and one study intersection under the Alternative Route 3 condition (to and from the Sheldon Pit) are also expected to be significantly impacted by the proposed project under the Year 2020 with Project conditions.

Incremental, but not significant, traffic impacts are noted in column [4] at the remaining study intersections with the addition of growth in ambient traffic, related projects traffic, and project traffic under Alternative Routes 1, 2, 3, and 4 conditions. Furthermore, no significant traffic impacts are expected at any of the study intersections during the mid-day peak hour conditions. The Year 2020 cumulative with project (existing, ambient growth, related projects and project) traffic volumes at the study intersections for Alternative Routes 1, 2, 3, and 4 during the weekday AM, Mid-day, and PM peak hours are shown in ***Appendix C-3***.

10.0 TRANSPORTATION IMPROVEMENT MEASURES

Based on the City of Los Angeles traffic analyses summarized in Section 9.0, it was determined that the proposed project could be expected to result in significant temporary traffic impacts at five study intersections under Alternative Route 1, six study intersections under Alternative Route 2, six study intersections under Alternative Route 3, and five study intersections under Alternative Route 4 in the Year 2020 Cumulative with Project conditions.

10.1 Transportation Mitigation Program

Transportation mitigation measures typically consist of improvements such as traffic signal installations/modifications and/or intersection restriping and roadway widening to accommodate additional travel lanes. However, as the project consists of a temporary condition comprised of hauling of removed sediment to one or more sediment disposal sites, no permanent transportation improvement measures are recommended. Therefore, the following paragraphs provide an overview of transportation demand management (TDM) measures recommended to reduce the respective temporary significant impacts to less than significant levels.

Transportation Demand Management Measures

Through consultation with LA County staff, a detailed sensitivity assessment was prepared aimed at reducing the project's significant traffic impacts to less than significant levels. The sensitivity assessment was prepared based on the following considerations:

- Evaluation of the potential (expanded) sediment disposal sites;
- Review of the various haul route options;
- Proposed hours of hauling operations;
- Review of the study intersection operations, particularly focusing on those locations documented to have current operational issues during either the AM and/or PM commute peak hours; and
- Evaluation of those study locations identified to be significantly impacted by the proposed project.

In order to minimize potential traffic impacts to the surrounding street system, it is recommended that TDM measures be implemented such that the proposed hauling operation would be scheduled with greater overall truck activity/operations occurring during the mid-day time period (generally from 10:00 AM to 3:00 PM), when background traffic volumes are typically lower than either the morning commute peak period (7:00 AM to 10:00 AM) or afternoon commute peak period (3:00 PM to 6:00 PM).

As shown previously in *Table 6-1*, a total of 23 trucks with 18 cubic-yard capacity or 30 trucks with 14 cubic-yard capacity was assigned during each of the AM, Mid-day, and PM peak hours

from the Pacoima Spreading Grounds site to the various disposal sites via a combination of Modified Haul Route A, Haul Route B, and Haul Route C. The recommended project hourly outbound (loaded) truck trips during the AM peak hour, Mid-day peak hour, and PM peak hour are summarized in ***Table 10-1***. The following traffic demand management strategies are recommended:

- For the AM peak hour condition, reduce the transport of 18-cy capacity trucks from a total of 23 trucks to 13 trucks, or reduce the transport of 14-cy capacity trucks from a total of 30 trucks to 16 trucks;

- For the Mid-day condition (approximately four hours), increase the transport of 18-cy capacity trucks from a total of 23 trucks hourly to 26 trucks, or increase the transport of 14-cy capacity trucks from a total of 30 trucks hourly to 34 trucks;

- For the PM peak period condition (approximately three hours), maintain the transport of 18-cy capacity trucks at a total of 23 trucks hourly (but with an adjusted assignment for Haul Route B and Haul Route C), or reduce the transport of 14-cy capacity trucks from a total of 30 trucks hourly to 29 trucks.

The recommended number of respective 18-cy capacity trucks and 14-cy capacity trucks utilizing the Modified Haul Route A, Haul Route B, and Haul Route C during the AM, Mid-day, and PM peak hour conditions are summarized in *Table 10-1*. The traffic generation forecast for the proposed project (with implementation of TDM measures) assuming the use of 18 cubic-yard capacity haul trucks is summarized in ***Table 10-2***. The traffic generation forecast for the proposed project (with implementation of TDM measures) assuming the use of 14 cubic-yard capacity haul trucks is summarized in ***Table 10-3***.

As presented in *Table 10-2*, using haul trucks with 18 cubic yard capacity per truck, the proposed project (with implementation of TDM measures) is expected to generate 82 PCE-adjusted vehicle trips (41 inbound trips and 41 outbound trips) during the weekday AM peak hour, 160 PCE-adjusted vehicle trips (80 inbound trips and 80 outbound trips) during the mid-day peak hour, and 142 PCE-adjusted vehicle trips (71 inbound trips and 71 outbound trips) during the PM peak hour. The proposed project is expected to generate 1,134 PCE-adjusted daily trip ends during a typical weekday (567 inbound trips and 567 outbound trips), including 18 employee trip ends. This equates to a total of 372 daily haul truck trips, if only 18 cubic yard trucks were used.

As presented in *Table 10-3*, using haul trucks with 14 cubic yard capacity per truck, the proposed project (with implementation of TDM measures) is expected to generate 86 PCE-adjusted vehicle trips (43 inbound trips and 43 outbound trips) during the weekday AM peak hour, 176 PCE-adjusted vehicle trips (88 inbound trips and 88 outbound trips) during the mid-day peak hour, and 150 PCE-adjusted vehicle trips (75 inbound trips and 75 outbound trips) during the PM peak hour. The proposed project is expected to generate 1,214 PCE-adjusted daily trip ends during a typical weekday (607 inbound trips and 607 outbound trips), including 18 employee trip ends. This equates to a total of 478 daily haul truck trips, if only 14 cubic yard trucks were used.

Table 10-1
SUMMARY OF RECOMMENDED TRANSPORTATION DEMAND MANAGEMENT MEASURES
PROPOSED PROJECT PEAK HOURLY OUTBOUND (LOADED) TRUCK TRIPS [1]

TRAFFIC ANALYSIS TIME PERIOD	OUTBOUND TO VULCAN MATERIALS SITE/S		OUTBOUND TO SUNSHINE CANYON LANDFILL	TOTAL
	MODIFIED HAUL ROUTE A	HAUL ROUTE B	HAUL ROUTE C	
Using 18 Cubic-Yard Capacity Trucks				
AM Peak Hour [2]	6	3	4	13
Mid-day Peak Hour [3]	8	5	13	26
PM Peak Hour [4]	8	8	7	23
Using 14 Cubic-Yard Capacity Trucks				
AM Peak Hour [2]	7	4	5	16
Mid-day Peak Hour [3]	10	7	17	34
PM Peak Hour [4]	10	10	9	29

Notes:

[1] Based on coordination with LA County staff, proposed hauling operations will occur Mondays through Fridays, between 9:00 AM and 5:30 PM (i.e., eight-hour days plus half-hour lunch).

[2] Typical weekday morning peak commute period is from 7:00 am to 10:00 am. For project-related traffic generation purposes, the AM Peak Hour reflects the hourly outbound total from 9:00 am to 10:00 am, since the hauling operations are proposed to begin at 9:00 am.

[3] Typical weekday mid-day period is from 10:00 am to 3:00 pm. For project-related traffic generation purposes, the Mid-day Peak Hour reflects the peak hourly outbound total between 10:00 am and approximately 2:30 pm (for approximately four hours during the Mid-day period).

[4] Typical weekday afternoon peak commute period is from 3:00 pm to 6:00 pm. For project-related traffic generation purposes, the PM Peak Hour reflects the peak hourly outbound total between approximately 2:30 pm and 5:30 pm (for approximately three hours during the PM peak period).

[C] Sunshine Canyon: 18-cy Truck Trips (unadjusted) [4]	164	4	4	8	13	13	26	7	7	14
[D] Vulcan: PCE Adjusted 18-cy Truck Trips [5]	624	27	27	54	39	39	78	48	48	96
[E] Sunshine Canyon: PCE Adjusted 18-cy Truck Trips [5]	492	12	12	24	39	39	78	21	21	42
Net Increase with 18-CY Trucks ([A]+[B]+[C])	**390**	**15**	**15**	**30**	**28**	**28**	**56**	**25**	**25**	**50**
Net PCE Increase with 18-CY Trucks ([A]+[D]+[E])	**1,134**	**41**	**41**	**82**	**80**	**80**	**160**	**71**	**71**	**142**

[1] Source: Based on coordination with LA County representatives and Psomas, the following are assumed:
Total sediment to be exported = 1,370,000 cubic yards (cy), with 1 cy = 1.5 tons
Up to 2,800 tons per day (tpd) will be exported to the Vulcan site/s and up to 2,200 tpd will be exported to the Sunshine Canyon Landfill site.
Hours of Truck Hauling Operations: Mondays to Fridays, 9:00 AM to 5:30 PM (8 hours of hauling per day are assumed)

[2] Trips are one-way traffic movements, entering or leaving.

[3] Daily truck trips to/from the Vulcan site/s were derived based on the following, using 18 cubic yard (cy) capacity per haul truck:
(2,800 tons per day) x (1 cy per 1.5 tons) = 1,867 cy per day / 18 cy per truck = 104 inbound trips + 104 outbound trips = 208 total daily truck trips.
Recommended transportation demand management measures to Vulcan site/s during the AM, Mid-day, and PM peak hours are as follows:
AM Peak Hour: Reduce the transport of 18-cy capacity trucks from 13 one-way truck trips to 9 one-way truck trips during the AM peak hour.
Mid-day Peak Hour: Maintain the transport of 18-cy capacity trucks at 13 one-way truck trips per hour during the Mid-day period.
PM Peak Hour: Increase the transport of 18-cy capacity trucks from 13 one-way truck trips to 16 one-way truck trips per hour during the PM peak period.

[4] Daily truck trips to/from the Sunshine Canyon Landfill site were derived based on the following, using 18 cubic yard (cy) capacity per haul truck:
(2,200 tons per day) x (1 cy per 1.5 tons) = 1,467 cy per day / 18 cy per truck = 82 inbound trips + 82 outbound trips = 164 total daily truck trips.
Recommended transportation demand management measures to Sunshine Canyon Landfill during the AM, Mid-day, and PM peak hours are as follows:
AM Peak Hour: Reduce the transport of 18-cy capacity trucks from 10 one-way truck trips to 4 one-way truck trips during the AM peak hour.
Mid-day Peak Hour: Increase the transport of 18-cy capacity trucks from 10 one-way truck trips to 13 one-way truck trips per hour during the Mid-day period.
PM Peak Hour: Reduce the transport of 18-cy capacity trucks from 10 one-way truck trips to 7 one-way truck trips per hour during the PM peak period.

[5] A passenger car equivalency (PCE) factor of 3.0 was employed for analysis purposes. This accounts for the assumption that a single 18 cubic yard capacity haul truck has the same overall affect on intersection traffic operations as 3.0 passenger cars.

Table 10-3
RECOMMENDED TRANSPORTATION DEMAND MANAGEMENT MEASURES
PROJECT TRIP GENERATION USING 14 CUBIC-YARD CAPACITY TRUCKS [1]

[B] Vulcan: 14-cy Truck Trips (unadjusted) [3]	268	11	11	22	17	17	34	20	20	40
[C] Sunshine Canyon: 14-cy Truck Trips (unadjusted) [4]	210	5	5	10	17	17	34	9	9	18
[D] Vulcan: PCE Adjusted 14-cy Truck Trips [5]	670	28	28	56	43	43	86	50	50	100
[E] Sunshine Canyon: PCE Adjusted 14-cy Truck Trips [5]	526	13	13	26	43	43	86	23	23	46
Net Increase with 14-CY Trucks ([A]+[B]+[C])	**496**	**18**	**18**	**36**	**36**	**36**	**72**	**31**	**31**	**62**
Net PCE Increase with 14-CY Trucks ([A]+[D]+[E])	**1,214**	**43**	**43**	**86**	**88**	**88**	**176**	**75**	**75**	**150**

[1] Source: Based on coordination with LA County representatives and Psomas, the following are assumed:
Total sediment to be exported = 1,370,000 cubic yards (cy), with 1 cy = 1.5 tons
Up to 2,800 tons per day (tpd) will be exported to the Vulcan site/s and up to 2,200 tpd will be exported to the Sunshine Canyon Landfill site.
Hours of Truck Hauling Operations: Mondays to Fridays, 9:00 AM to 5:30 PM (8 hours of hauling per day are assumed)

[2] Trips are one-way traffic movements, entering or leaving.

[3] Daily truck trips to/from the Vulcan site/s were derived based on the following, using 14 cubic yard (cy) capacity per haul truck:
(2,800 tons per day) x (1 cy per 1.5 tons) = 1,867 cy per day / 14 cy per truck = 134 inbound trips + 134 outbound trips = 268 total daily truck trips.
Recommended transportation demand management measures to Vulcan site/s during the AM, Mid-day, and PM peak hours are as follows:
AM Peak Hour: Reduce the transport of 14-cy capacity trucks from 17 one-way truck trips to 11 one-way truck trips during the AM peak hour.
Mid-day Peak Hour: Maintain the transport of 14-cy capacity trucks at 17 one-way truck trips per hour during the Mid-day period.
PM Peak Hour: Increase the transport of 14-cy capacity trucks from 17 one-way truck trips to 20 one-way truck trips per hour during the PM peak period.

[4] Daily truck trips to/from the Sunshine Canyon Landfill site were derived based on the following, using 14 cubic yard (cy) capacity per haul truck:
(2,200 tons per day) x (1 cy per 1.5 tons) = 1,467 cy per day / 14 cy per truck = 105 inbound trips + 105 outbound trips = 210 total daily truck trips.
Recommended transportation demand management measures to Sunshine Canyon Landfill during the AM, Mid-day, and PM peak hours are as follows:
AM Peak Hour: Reduce the transport of 14-cy capacity trucks from 13 one-way truck trips to 5 one-way truck trips during the AM peak hour.
Mid-day Peak Hour: Increase the transport of 14-cy capacity trucks from 13 one-way truck trips to 17 one-way truck trips per hour during the Mid-day period.
PM Peak Hour: Reduce the transport of 14-cy capacity trucks from 13 one-way truck trips to 9 one-way truck trips per hour during the PM peak period.

[5] A passenger car equivalency (PCE) factor of 2.5 was employed for analysis purposes. This accounts for the assumption that a single 14 cubic yard capacity haul truck has the same overall affect on intersection traffic operations as 2.5 passenger cars.

Other Considerations

In addition to the above transportation demand management strategies, the following recommendations are noted for consideration so as to minimize to the extent feasible the significant traffic impacts (potential benefits due to these measures are not included/assumed in the level of service calculations):

- Coordinate hauling activities so as to reduce the potential of trucks waiting to unload for protracted periods of time;
- Prohibit parking by construction workers on adjacent streets and directing the construction workers to available parking within the project site.

10.2 Effectiveness of Mitigation Measures

The results of the analysis of traffic conditions associated with the recommended transportation demand management measures are summarized in *Tables 9-1, 9-2, 9-3,* and *9-4* for Alternatives 1, 2, 3, and 4, respectively. As shown in column [5] of *Tables 9-1, 9-3,* and *9-4*, the recommended demand management measures are expected to reduce the project-related temporary traffic impacts to less than significant levels at all of the impacted study intersections under Alternatives 1, 3, and 4. Furthermore, as shown in column [5] of *Tables 9–1, 9-3,* and *9-4,* with the small increase of truck trips during the Mid-day conditions, no new significant traffic impacts are identified.

As shown in column [5] of *Table 9-2* for Alternative 2, the recommended demand management measures are expected to reduce the project-related temporary traffic impacts to less than significant levels at five of the six impacted study intersections. The following intersection is expected to remain significant during the AM peak hour under Alternative 2:

- Int. 6: San Fernando Road/Branford Street

As stated previously, the project consists of a temporary condition comprised of hauling of removed sediment to one or more sediment disposal sites. As a result, no permanent transportation improvement measures are recommended. It is recommended for LA County consideration that Alternative Route 2 (Use of Boulevard Pit Only and Sunshine Canyon Landfill) be eliminated as a potential haul route. Therefore, if only Alternative Route 1, Alternative Route 3, or Alternative Route 4 are considered for implementation, no significant residual traffic impacts due to the proposed temporary construction project are expected. The corresponding CMA data worksheets are contained in *Appendix C.*

11.0 SUPPLEMENTAL REVIEW OF THE KEWEN AVENUE/PAXTON STREET INTERSECTION

During the Pacoima Spreading Grounds Improvement Project's Initial Study review process, the intersections of Telfair Avenue/Paxton Street, San Fernando Road/Paxton Street, and San Fernando Road/Van Nuys Boulevard along the proposed Haul Route B and the Woodman Avenue/Devonshire Street intersection were requested for analysis of potential traffic impacts. All four requested intersections have been thoroughly evaluated pursuant to the City of Los Angeles' traffic analysis methodologies (refer to Section 9.0). Based on application of the City of Los Angeles significant traffic impact criteria, the proposed project is not expected to create any significant traffic impacts at these intersections.

Since use of the proposed Haul Route B will traverse Paxton Street, a supplemental review has also been conducted at the unsignalized Kewen Avenue/Paxton Street intersection, which is located immediately adjacent to Telfair Elementary School. The Kewen Avenue/Paxton Street intersection is presently a T-intersection controlled by a stop sign facing the northbound Kewen Avenue approach with unrestricted flow on Paxton Street. The methodology outlined in the *Highway Capacity Manual* (HCM) for unsignalized intersections has been utilized to determine the individual movement and approach delays expected to be experienced by motorists traversing through this intersection. A description of the HCM method and corresponding Level of Service is provided in ***Appendix D***. The supplemental intersection analyses for the existing, existing with project, Year 2020 cumulative without project, and Year 2020 cumulative with project conditions are summarized in ***Table 11-1***. The corresponding weekday AM, Mid-day, and PM peak hour summary data worksheets of the supplemental intersection analyses are also contained in *Appendix D*.

As shown in *Table 11-1* and the corresponding HCM data worksheets, the reported values represent the worst case (i.e., highest) approach delays and LOS that are expected to occur at the northbound Kewen Avenue approach to the intersection. The worst case approach of this intersection is forecast to operate at LOS D or better under all analysis time periods and conditions, except the Year 2020 cumulative with or without the proposed project where LOS E operation is identified during the AM peak hour condition. As previously discussed and presented in *Tables 9-1, 9-2, 9-3,* and *9-4*, application of the City of Los Angeles' threshold criteria has indicated incremental, but not significant, traffic impacts at this study intersection under all analysis time periods and conditions. Additionally, it should be noted that the passenger loading/unloading zones associated with Telfair Elementary School during the morning school drop-off and afternoon pick-up time periods are located along Telfair Avenue and Weidner Street (i.e., not on Paxton Street along the proposed Haul Route B). As such, delays to motorists traversing through this intersection are not expected to be adversely affected by the project, however LOS E conditions are reported/forecast in the Year 2020 cumulative without project condition.

Table 11-1
SUPPLEMENTAL INTERSECTION ANALYSIS [a]
WEEKDAY AM, MID-DAY, AND PM PEAK HOURS

NO.	INTERSECTION	PEAK HOUR	[1] YEAR 2017 EXISTING DELAY [b]	[1] YEAR 2017 EXISTING LOS [c]	[2] YEAR 2017 EXISTING W/ PROJECT DELAY [b]	[2] YEAR 2017 EXISTING W/ PROJECT LOS [c]	[2] CHANGE IN DELAY [(2)-(1)]	[3] YEAR 2020 CUMULATIVE W/O PROJECT DELAY [b]	[3] YEAR 2020 CUMULATIVE W/O PROJECT LOS [c]	[4] YEAR 2020 CUMULATIVE W/ PROJECT DELAY [b]	[4] YEAR 2020 CUMULATIVE W/ PROJECT LOS [c]	[4] CHANGE IN DELAY [(4)-(3)]

[a] Intersection analysis based on the Highway Capacity Manual operational analysis methodologies.

[b] Reported control delay values in seconds per vehicle. Refer to the analysis worksheets contained in Appendix D.

[c] Unsignalized Intersection Levels of Service are based on the following criteria:

LOS	Control Delay (s/veh)
A	<= 10
B	> 10-15
C	> 15-25
D	> 25-35
E	> 35-50
F	> 50

[d] Two-Way Stop-Controlled Intersection. Reported values represent the delays associated with the most constrained approach of the intersection.

12.0 CONGESTION MANAGEMENT PROGRAM TRAFFIC IMPACT ASSESSMENT

The Congestion Management Program (CMP) is a state-mandated program that was enacted by the California State Legislature with the passage of Proposition 111 in 1990. The program is intended to address the impact of local growth on the regional transportation system.

As required by the 2010 Congestion Management Program, a Traffic Impact Assessment (TIA) has been prepared to determine the potential impacts on designated monitoring locations on the CMP highway system. The analysis has been prepared in accordance with procedures outlined in the *2010 Congestion Management Program*, Los Angeles County Metropolitan Transportation Authority, October 2010.

12.1 Intersections

There are no CMP intersection monitoring locations within the vicinity of the project. The CMP TIA guidelines require that intersection monitoring locations must be examined if the proposed project will add 50 or more trips during either the weekday AM or PM peak hours. The proposed project will not add 50 or more trips during either the weekday AM or PM peak hours (i.e., of adjacent street traffic) at the CMP monitoring intersections, as stated in the CMP manual as the threshold criteria for a traffic impact assessment. Therefore, no further review of potential impacts to intersection monitoring locations that are part of the CMP highway system is required.

12.2 Freeways

The following CMP freeway monitoring locations nearest to the project site has been identified:

CMP Station	Location
Seg. No. 1007	I-5 Freeway near Osborne Street
Seg. No. 1053	SR-118 Freeway west of I-210 Freeway
Seg. No. 1059	I-210 Freeway at Terra Bella Street
Seg. No. 1072	I-405 Freeway north of Roscoe Boulevard

The CMP TIA guidelines require that freeway monitoring locations must be examined if the proposed project will add 150 or more trips (in either direction) during either the weekday AM or PM peak hours. The proposed project will not add 150 or more trips (in either direction) during either the weekday AM or PM peak hours to the CMP freeway monitoring location, which is the threshold for preparing a traffic impact assessment, as stated in the CMP manual. Therefore, no further review of potential impacts to freeway monitoring locations that are part of the CMP highway system is required.

12.3 Transit Impact Review

As required by the *2010 Congestion Management Program*, a review must be made of CMP transit service. As previously discussed, the project consists of a temporary sediment removal project involving the addition of haul trucks to the surrounding street system. Thus, increased demand on the existing transit service/s provided in the vicinity of the proposed project is not expected. Therefore, no further analysis is warranted as no impacts to future transit services in the project area would occur as a result of the proposed project.

13.0 CALIFORNIA DEPARTMENT OF TRANSPORTATION IMPACT ANALYSIS

During the Pacoima Spreading Grounds Improvement Project's Initial Study review process, the California Department of Transportation (Caltrans) provided a formal comment letter dated February 11, 2016. The letter states that Caltrans does not expect the project approval will result in a direct adverse impact to the existing State transportation facilities. As a result, the following supplemental Caltrans freeway mainline analysis is provided for informational purposes only. The following supplemental Caltrans analysis was prepared based on the latest edition of the Highway Capacity Manual operational analysis methodologies pursuant to the Caltrans' *Guide for the Preparation of Traffic Impact Studies*[4]. Based on recent coordination with Caltrans, analyses of Caltrans facilities should be conducted when and if a proposed project is expected to add 50 or more peak hour trips in either direction on a freeway mainline segment.

13.1 Freeway Mainline Segment Review

The following mainline freeway segments been identified for assessment based on their proximity to the project site and the identified haul routes to access each of the sediment disposal sites:

- I-5 Freeway south of Roxford Street
- I-5 Freeway north of Osborne Street
- I-5 Freeway south of Laurel Canyon Boulevard
- SR-118 Freeway east of San Fernando Road
- I-210 Freeway west of Foothill Boulevard
- I-405 Freeway north of SR-118 Freeway

As shown in ***Table 13-1***, the proposed project is not expected to generate 50 or more vehicle trips, during either the AM, mid-day, or PM peak hours at any freeway mainline location. Thus, any freeway mainline location would not exceed the threshold for preparation of a Caltrans freeway mainline analysis. Therefore, no further analysis of Caltrans freeway mainline segments is required.

[4] *Guide for the Preparation of Traffic Impact Studies*, State of California Department of Transportation, December 2002.

[1] Freeway assessment per the Caltrans' *Guide for the Preparation of Traffic Impact Studies* , December 2002, and recent coordination with Caltrans.

[2] Based on the project trip generation and trip distribution for the project. For the purposes of this analysis, the trips shown represent the maximum number of trips assigned to the freeway segment by any of the alternative routes.

14.0 CONCLUSIONS

This traffic impact study has been prepared to identify and evaluate the potential impacts of traffic generated by the proposed temporary Pacoima Spreading Grounds Improvement project. In order to provide a conservative assessment of potential project-related impacts, this traffic impact study assumes analysis of four alternative haul routes depending upon which of the available Vulcan Materials sediment disposal sites are being used (including Alternative Route 1 which assumes all three Vulcan Materials disposal sites are being used concurrently). It should be noted that each of the four alternative haul routes under consideration will include the use of the Sunshine Canyon Landfill site. Completion of the sediment removal operations are anticipated by year 2020.

The proposed temporary project is expected to generate 156 PCE-adjusted vehicle trips (78 inbound trips and 78 outbound trips) during the weekday AM, mid-day, and PM peak hours using 14 cubic yard capacity trucks. The proposed project is expected to generate 1,214 PCE-adjusted daily trip ends during a typical weekday (607 inbound trips and 607 outbound trips) including employee trips. This equates to a total of 478 daily haul truck trips. In reality, a mix of 18-cy and 14-cy trucks would be used (i.e., resulting between 372 and 478 total daily truck trips).

In order to evaluate the potential impacts to the local street system, 56 intersections were identified for evaluation to determine changes in traffic operations due to the proposed project. Since hauling operations are expected to occur throughout the day the weekday AM, Mid-day, and PM peak hour conditions were identified for analysis. All study intersections were evaluated using the City of Los Angeles analysis methodologies and significant traffic impact thresholds.

Based on the results of the traffic analysis, it was determined that the proposed project could be expected to result in significant temporary traffic impacts at five study intersections under Alternative Route 1, six study intersections under Alternative Route 2, six study intersections under Alternative Route 3, and five study intersections under Alternative Route 4 in the Year 2020 Cumulative with Project conditions. Incremental but less than significant impacts are noted at the remaining study intersections in the Year 2020 Cumulative with Project conditions. Since this project is a temporary construction project, formal and permanent transportation improvement measures have not been recommended. Rather, transportation demand management measures aimed at reducing the project-related truck trips during the AM and PM peak hours while increasing the truck trips during the Mid-day time period (when in general the overall background traffic volumes are lower) are recommended. The recommended transportation demand management measures are expected to reduce the project-related temporary traffic impacts to less than significant levels at all impacted study intersections under the Alternative Route 1, Alternative Route 3, and Alternative Route 4 conditions. For the Alternative Route 2 condition, the recommended transportation demand management measures are expected to reduce the project-related temporary traffic impacts to less than significant levels at five of the six impacted study intersections. One study intersection is expected to remain significantly impacted during the AM peak hour under the Alternative Route 2 condition. It is

recommended for LA County consideration that Alternative Route 2 (Use of Boulevard Pit Only and Sunshine Canyon Landfill) be eliminated as a potential haul route. Therefore, if only Alternative Route 1, Alternative Route 3, or Alternative Route 4 are considered for implementation, no significant residual traffic impacts due to the proposed temporary construction project are expected.

The results of the Los Angeles County Congestion Management Program (CMP) traffic assessment indicated that the proposed project will not adversely affect any CMP arterial monitoring intersections or freeway monitoring locations. Therefore, no improvements/mitigation measures are required of this project on the CMP facilities.

The proposed project is not expected to generate 50 or more vehicle trips, during either the AM, Mid-day, or PM peak hours, at any freeway mainline locations. Thus, freeway mainline analysis is not required as the threshold for preparation of a Caltrans freeway mainline analysis is not met.
