1.0 INTRODUCTION

1.1 Purpose of Analysis and Study Objectives

This Air Quality, Greenhouse Gas (GHG) Emissions, and Health Risk Assessment (HRA) Impact Analysis has been completed to determine the air quality, GHG emissions, and toxic air contaminant (TAC) impacts associated with the proposed Pacoima Spreading Grounds Improvement Project (proposed project). The following is provided in this report:

- A description of the proposed project;
- A description of the atmospheric setting;
- A description of the criteria pollutants and greenhouse gases (GHGs);
- A description of the air quality regulatory framework;
- A description of the air quality and GHG emissions thresholds including the California Environmental Quality Act (CEQA) significance thresholds;
- An analysis of the short-term construction related and long-term operational air quality and GHG emissions impacts;
- An analysis of the cancer risk and non-cancer acute and chronic health risk from diesel emissions created during construction of the proposed project;
- An analysis of the conformity of the proposed project with the South Coast Air Quality Management District (SCAQMD) Air Quality Management Plan (AQMP); and
- An analysis of the conformity of the proposed project with all applicable GHG emissions reduction plans and policies.

1.2 Site Location and Study Area

The project site is located in the northern portion of the City of Los Angeles (City) and on the west side of the Pacoima Diversion Channel. The project site is approximately 169 acres in area, bisected by Arleta Avenue and Devonshire Street and is hydraulically connected by pipes underneath these roads. The project site is bordered by Filmore Street to the southeast, Woodman Avenue to the west, San Jose Street to the north, and Arleta Avenue to the northeast and is bisected by Devonshire Street. The project local study area is shown on page 8 in Figure 1.

1.3 Proposed Project Description

The principle objective of the proposed project is to increase groundwater recharge of the San Fernando Groundwater Basin by increasing the facility's storage capacity and restoring its percolation rate through excavation and removal of underlying clay layers. The proposed project would include improvements to the intake structure as well as expansion and reconfiguration of the spreading basins. The proposed site plan is shown on page 9 in Figure 2.

Intake Structure Improvements

The existing intake structure will be improved by replacing the current intake canal with four 54-inch diameter RCPs. The pipes will extend from the headworks to the culverts that convey water to the spreading basins. After the pipes are installed, the intake channel will be backfilled with approximately 27,850 cubic yards of sediment removed from the spreading basins. Due to the variability of uncontrolled flows in Pacoima Diversion Channel, careful operation of the radial gate is currently required to regulate flows into

the intake canal. When flows in excess of 600 cubic feet per second (cfs) enter the intake canal, water can potentially overtop the intake canal, resulting in localized flooding. Replacing the intake canal with pipes will restrict the intake to the design flow rate of 600 cfs and eliminate the potential for overtopping the intake canal.

Recharge Basin Reconfiguration and Sediment Removal

The recharge basins will be reconfigured and deepened to allow for greater percolation and capacity. Approximately 1.6 million cubic yards of sediment will be excavated in order to completely remove the underlying clay layers; however, only 1.37 million cubic yards of sediment will be exported from the site. The remainder of the sediment will be used to backfill the existing intake channel or be returned to the spreading basins to bring the basin inverts up to their finished elevation.

The proposed project includes transportation and placement of excavated material at facilities prepared and designated to accept such material. A total of up to 2,800 tons per day will be exported to three sediment disposal sites have been identified for consideration, either individually or in combination: Boulevard Pit, Sheldon Pit, and the Cal-Mat Pit. All three of these sites are located in the Sun Valley area of Los Angeles. In addition up to 2,200 tons per day, consisting of all organic material, concrete demolition, and some sediment will be transported Sunshine Canyon Landfill that is located northwest of the Pacoima Spreading Grounds.

The haul routes from the Pacoima Spreading Grounds site to the sediment disposal sites and to Sunshine Canyon Landfill have been identified that are detailed below:

- **Modified Haul Route A to Boulevard Pit.** Loaded trucks would travel northeast on Paxton Street to access the I-5 Southbound Freeway, taking the Sheldon Street exit and turning (right) onto Laurel Canyon Boulevard and then turn east (right) on Branford Street to access the Boulevard Pit (5.4 miles). The trucks would return from Boulevard Pit by traveling east on Branford Street and turning (left) on to Glen Oaks Boulevard to north on Osborne Street, to east on Foothill Boulevard, to I-210 westbound, to SR-118 westbound, and finally exiting at San Fernando Boulevard to return to the Pacoima Spreading Grounds on Paxton Avenue (8.4 miles). The round trip would be 13.8 miles.

- **Modified Haul Route A to Sheldon and Cal-Mat Pits**. Loaded trucks would travel northeast on Paxton Street to access the I-5 Southbound Freeway, taking the Penrose Street exit and turning (right) onto San Fernando Road and then turn east (right) on Tuxford Street and then turn west (left) onto Glenoaks Boulevard to access both the Sheldon Pit and Cal-Mat Pit (average of 7.5 miles). The trucks would return by traveling west on Glen Oaks Boulevard to north on Osborne Street, to east on Foothill Boulevard, to I-210 westbound, to SR-118 westbound, and finally exiting at San Fernando Boulevard to return to the Pacoima Spreading Grounds on Paxton Avenue (average of 8.4 miles). The average round trip would be 15.9 miles.

- **Haul Route B to Boulevard, Sheldon and Cal-Mat Pits**. Loaded trucks would travel northeast on Paxton Street to access San Fernando Road. Heading south on San Fernando Road, the trucks either turn northeast (left) on Branford Street and then turn right on Glenoaks Boulevard to access the Sheldon Pit or Cal-Mat Pit (5.3 miles), or turn southwest (right) on Branford Street to access the Boulevard Pit (3.8 miles). The trucks would return be retracing the same route. The average round trip would be 9.6 miles if all three Pits are used or 10.6 miles if only Sheldon and Cal-mat pits are used.

- **Haul Route C to Sunshine Canyon Landfill.** Loaded trucks would travel west on Devnoshire Street to access the I-405 Northbound Freeway and I-5 Northbound Freeway, exiting the I-5 Freeway at Roxford Street, then head southwest on Roxford Street, northwest on Sepulveda Boulevard, northwest on San Fernando Road, and then turn left onto Sunshine Canyon Road to access the Sunshine Canyon Landfill (6.9 miles). The trucks would return retracing the same route. The average round trip would be 13.8 miles.

As detailed in Table 10-1 of the *Traffic Impact Study Pacoima Spreading Grounds Improvement Project* (Traffic Study), prepared by Linscott Law & Greenspan, July, 2017, 35 percent of the haul trucks would use Route A, 26 percent of the haul trucks would use Route B and 39 percent of the haul trucks would use Route C.

Project Schedule

The proposed project is expected to occur over an approximately 20-month period, starting in 2018 and would be completed in 2020. Excavation activities will take place year-round, and the spreading grounds will not be operated for the duration of the proposed project's construction. Activities will take place five days a week between the hours of 9:00 a.m. and 5:30 p.m. on Monday through Friday, with a 30 minute lunch break, for a total workday of 8 hours.

1.4 Sensitive Receptors in Project Vicinity

The project site is located in a residential community and is surrounded on all sides by residential as well as park and worship uses. As detailed in the site plan shown in Figure 2, the proposed improvements would disturb most but not all of the property, as there are areas around the perimeter of the spreading basins that would not be disturbed. The nearby off-site sensitive receptors to each portion of the proposed project are detailed below and the distances are based on the distance from the proposed disturbed areas on the project site to the nearest structure for homes and the church or use area for parks.

West Settling Basin

The proposed West Settling Basin is located on the northern side of the project site and is bounded by Arleta Avenue to the northeast. The nearby sensitive receptors consist of: single-family homes located on the south side of San Jose Street and as near as 40 feet north of the proposed improvements; and single-family homes located on the northeast side of Arleta Avenue and as near as 130 feet northeast of the proposed improvements to the West Settling Basin.

East Settling Basin

The proposed East Settling Basin is located on the eastern side of the project site and is bounded by Arleta Avenue to the northeast and Devonshire Street to the south. The nearby sensitive receptors consist of: Devonshire Arleta Park that is located as near as 220 feet east of the proposed improvements; and single-family homes located on the east side of Pacoima Diversion Channel and as near as 280 feet east of the proposed improvements to the East Settling Basin.

Basin 1

The proposed Basin 1 is located on the eastern corner of the project site and is bounded by Devonshire Street to the north, Pacoima Diversion Channel to the east and Filmore Street to the southeast. The nearby sensitive receptors consist of: Devonshire Arleta Park that is located as near as 220 feet northeast of the proposed improvements; single-family homes located on the east side of Pacoima Diversion Channel and as near as 170 feet east of the proposed improvements; and single- and multi-family homes located on the southeast side of Filmore Street and as near as 125 feet southeast of the proposed improvements to Basin 1.

Basin 2

The proposed Basin 2 is located on the southeastern side of the project site and is bounded by Devonshire Street to the north and Filmore Street to the southeast. The nearby sensitive receptors consist of single-family homes located on the southeast side of Filmore Street and as near as 120 feet southeast of the proposed improvements to Basin 2.

Basin 3

The proposed Basin 3 is located on the northern side of the project site and is bounded by West Settling Basin to the east and the SCE Easement to the west. The nearby sensitive receptors consist of: single-family homes located on the south side of San Jose Street and as near as 70 feet north of the proposed improvements; and single-family homes on the east side of Hiawatha Street and as near as 70 feet west of the proposed improvements to Basin 3.

Basin 4

The proposed Basin 4 is located on the northwestern corner of the project site and is bounded by the SCE Easement to the east and Devonshire Street to the south. The nearby sensitive receptors consist of: single-family homes located on the south side of Hiawatha Street and as near as 50 feet north of the proposed improvements; and single-family homes on the east side of Blackhawk Street and as near as 60 feet west of the proposed improvements to Basin 4.

Basin 5

The proposed Basin 5 is located on the western side of the project site and is bounded by Devonshire Street to the north and Devonwood Park to the west. The nearby sensitive receptors consist of: Devonwood Park located as near as 30 feet west of the proposed improvements; and single-family homes located on the north side of Devonshire Street and as near as 135 feet north of the proposed improvements to Basin 5.

Basin 6

The proposed Basin 6 is located on the southwest corner of the project site and is bounded by and Devonwood Park to the north, Woodman Avenue to the southwest and Filmore Street to the southeast. The nearby sensitive receptors consist of: Devonwood Park located as near as 40 feet north of the proposed improvements; the New Apostolic Church located on the east side of Woodman Avenue and as near as 30 feet west of the proposed improvements; and single-family homes located on the east side of Woodman Avenue and as near as 30 feet west of the proposed improvements to Basin 6.

Diversion Channel Intake

The proposed diversion channel intake improvements is located in the northeast corner of the project site and is bounded by the Pacoima Diversion Channel to the east and Arleta Avenue to the southwest. The nearby sensitive receptors consist of single-family homes located on the east side of Minnehaha Street and as near as 40 feet west of the proposed improvements to the diversion channel intake.

Haul Routes

The roadways with nearby sensitive receptors to each of the four proposed haul routes described above are detailed below.

- **Modified Haul Route A to Boulevard Pit.** There are sensitive receptors located on the roadways of Arleta Avenue, Paxton Street, Laurel Canyon Road, Branford Street, Glenoaks Boulevard, Osborne Street, and Foothill Boulevard. Modified Haul Route A to Boulevard Pit would also travel on Devonshire Street, San Fernando Road, however there are no sensitive receptors located along the affected road segments.

- **Modified Haul Route A to Sheldon Pit and Cal-Mat Pit.** There are sensitive receptors located on the roadways of Arleta Avenue, Paxton Street, Glenoaks Boulevard, Osborne Street, and Foothill Boulevard. Modified Haul Route A to Sheldon and Cal-Mat Pits would also travel on Devonshire Street, Penrose Street, Tuxford Street, Wentworth Street, and San Fernando Road, however there are no sensitive receptors located along the affected road segments.

- **Haul Route B.** There are sensitive receptors located on the roadways of Arleta Avenue, Paxton Street and San Fernando Road. Haul Route B would also travel on Devonshire Street, Branford Street, Wentworth Street, and San Fernando Road, however there are no sensitive receptors located along the affected road segments.

- **Haul Route C.** There are sensitive receptors located on the roadways of Devonshire Street, Roxford Street, and San Fernando Road. Haul Route C would also travel on Sepulveda Boulevard, however there are no sensitive receptors located along the affected road segments.

The nearby sensitive receptors on Paxton Street consist of: single- and multi-family homes that are located as near as 20 feet from the travel lanes; Ritchie Valens Park that is located as near as 15 feet from the travel lanes; and Telfair Elementary School that is located as near as 25 feet from the travel lanes of Paxton Street.

The nearby sensitive receptors on Laurel Canyon Boulevard consist of: multi-family and mobile homes as near as 25 feet from the travel lanes; and Fernangeles Recreation Center located as near as 15 feet from the travel lanes of Laurel Canyon Boulevard.

The nearby sensitive receptors on Branford Street consist of single- and multi-family homes as near as 25 feet from the travel lanes of Branford Street.

The nearby sensitive receptors on Glenoaks Boulevard consist of mobile homes as near as 20 feet from the travel lanes of Glen Oaks Boulevard.

The nearby sensitive receptors to Osborne Street consist of multi-family homes as near as 15 feet from the travel lanes of Osborne Street.

The nearby sensitive receptors to Foothill Boulevard consist of multi-family homes as near as 25 feet from the travel lanes of Foothill Boulevard.

The nearby sensitive receptors on San Fernando Road consist of: single- and multi-family homes as near as 110 feet from the travel lanes; and Pacifica Hospital of the Valley that is located as near as 180 feet from the travel lanes of San Fernando Road. For the portion of San Fernando Road near Sunshine Canyon Landfill the nearby sensitive receptors consist of single-family homes as near as 90 feet from the travel lanes.

1.5 Standard Air Quality and GHG Regulatory Conditions

The proposed project will be required to comply with the following regulatory conditions from the SCAQMD and State of California (State).

South Coast Air Quality Management District Rules

The following lists the SCAQMD rules that are applicable to all earth moving projects in the South Coast Air Basin.

Rule 402 - Nuisance

Rule 402 prohibits a person from discharging from any source whatsoever such quantities of air contaminants or other material which causes injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. Compliance with Rule 402 will reduce local air quality and odor impacts to nearby sensitive receptors. It should be noted that the SCAQMD receives and investigates odor complaints from nearby residents and if six or more odor events are reported in a year the SCAQMD will consider the odor impact a nuisance and has the authority to require the offender to implement measures to reduce the odor impacts.

Rule 403- Fugitive Dust

Rule 403 governs emissions of fugitive dust during construction activities and requires that no person shall cause or allow the emissions of fugitive dust such that dust remains visible in the atmosphere beyond the property line or the dust emission exceeds 20 percent opacity, if the dust is from the operation of a motorized vehicle. Compliance with this rule is achieved through application of standard Best Available Control Measures, which include but are not limited to the measures below. The proposed project has the potential to be classified a "Large Operation" as it may contain 50 or more acres of disturbed surface area and the daily earth-moving or throughput volume may exceed 5,000 cubic yards. Compliance with the following rules would reduce local air quality impacts to nearby sensitive receptors.

- Submit a Large Operation Notification to the SCAQMD and maintain daily records of the specific dust control actions taken.
- Install and maintain project signage on the various visible places around the project site that provides a contact person and phone number to for persons to call when they see dust leaving the project site. The signage shall also have a phone number for the SCAQMD compliance office.
- Utilize either a pad of washed gravel 50 feet long, 100 feet of paved surface, a wheel shaker, or a wheel washing device to remove material from vehicle tires and undercarriages before leaving project site.
- Do not allow any track out of material to extend more than 25 feet onto a public roadway and remove all track out at the end of each workday.
- Water all exposed areas on active sites at least three times per day and pre-water all areas prior to clearing and soil moving activities.
- Pre-water all material to be exported prior to loading, and either cover all loads or maintain at least 2 feet of freeboard in accordance with the requirements of California Vehicle Code Section 23114.
- Restrict traffic speeds on all unpaved roads to 15 miles per hour or less.
- Maintain a soil moisture content at a minimum of 12 percent that shall be measured a minimum of two times during the first three hours and two times each subsequent four hour periods each day.
- Water all dirt roads at least once per every two hours of active operations or apply a chemical stabilizer in sufficient quantity and frequency to maintain a stabilized surface.

State of California Rules

The following lists the State of California rules that are applicable to all earth moving projects in the State.

CARB Regulation for In-Use Off-Road Diesel Vehicles

On July 26, 2007, the California Air Resources Board (CARB) adopted a regulation to reduce diesel particulate matter (DPM) and NOx emissions from in-use off-road heavy-duty diesel vehicles in California. Such vehicles are used in construction, mining, and industrial operations. The regulation limits idling to no more than five consecutive minutes, requires reporting and labeling, and requires disclosure of the regulation upon vehicle sale. Performance requirements of the rule are based on a fleet's average NOx emissions, which can be met by replacing older vehicles with newer, cleaner vehicles or by applying exhaust retrofits. The regulation was amended in 2010 to delay the original timeline of the performance requirement making the first compliance deadline January 1, 2014 for large fleets (over 5,000 horsepower), 2017 for medium fleets (2,501-5,000 horsepower), and 2019 for small fleets (2,500 horsepower or less). Currently, no commercial company in California may add any equipment to their fleet that has a Tier 0 engine and medium and large fleets are restricted from adding Tier 1 engines. By January 1, 2016 small fleet will also be restricted from adding Tier 1 engines to their fleets and by January 1, 2018 medium and large fleets will be restricted from adding Tier 2 engines to their fleets. It should be noted that commercial fleets may continue to use their existing Tier 0 and 1 equipment, if they can demonstrate that the average emissions from their entire fleet emissions meet the NOx emissions targets.

CARB Resolution 08-43 for On-Road Diesel Truck Fleets

On December 12, 2008 the CARB adopted Resolution 08-43, which limits NOx, PM10 and PM2.5 emissions from on-road diesel truck fleets that operate in California. On October 12, 2009 Executive Order R-09-010 was adopted that codified Resolution 08-43 into Section 2025, title 13 of the California Code of Regulations. This regulation requires that by the year 2023 all commercial diesel trucks that operate in California shall meet model year 2010 (Tier 4 Final) or latter emission standards. In the interim period, this regulation provides annual interim targets for fleet owners to meet. By January 1, 2014, 50 percent of a truck fleet is required to have installed Best Available Control Technology (BACT) for NOx emissions and 100 percent of a truck fleet installed BACT for PM10 emissions. This regulation also provides a few exemptions including a onetime per year 3-day pass for trucks registered outside of California. All on-road diesel trucks operating on the project site will be required to comply with Resolution 08-43.

1.6 Summary of Analysis Results

The following is a summary of the proposed project's impacts with regard to the State CEQA Guidelines air quality and GHG emissions checklist questions.

Conflict with or obstruct implementation of the applicable air quality plan?

Potentially significant impact. Implementation of Mitigation Measures 1 and 2 would reduce the impact to less than significant levels.

Violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Potentially significant impact. Implementation of Mitigation Measures 1 and 2 would reduce the impact to less than significant levels.

Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard?

Potentially significant impact. Implementation of Mitigation Measures 1 and 2 would reduce the impact to less than significant levels.

Expose sensitive receptors to substantial pollutant concentrations?

Potentially significant impact. Implementation of Mitigation Measures 1 and 2 would reduce the impact to less than significant levels.

Create objectionable odors affecting a substantial number of people?

Less than significant impact.

Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

Less than significant impact.

Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs?

Less than significant impact.

1.7 Mitigation Measures Required for the Proposed Project

This analysis found that implementation of the State and SCAQMD air quality and GHG emissions reductions regulations detailed in Section 1.5 above and through implementation of the following mitigation, all criteria pollutants, toxic air contaminants, odors, and GHG emissions from the proposed project would be reduced to less than significant levels.

Mitigation Measure 1

The project applicant shall require that all off-road diesel-powered construction equipment greater than 50 horsepower shall meet the Tier 4 Final emissions standards and shall be registered with CARB and labelled detailing that the equipment meets Tier 4 emissions standards.

Mitigation Measure 2

Prior to the start of haul truck operations, the project applicant shall pave, install the All Terrain Road™ Composite Mat System, or a similar product to the All Terrain Road™ that is no less effective than a paved road at controlling fugitive dust emissions on the top of the central levee spanning the spreading grounds in a northeast-southwest direction. The paving or Composite Mat System shall be of sufficient length to cover the greater of either: (1) a minimum of 25 percent of the total off-road path length being utilized by the haul trucks within the spreading grounds; or (2) a minimum of 660 linear feet (1/8 mile) of the paving or Composite Mat System. The paving or Composite Mat System shall be routinely inspected and maintained, as often as needed to ensure the integrity of the surface and eliminate fugitive dust emissions from the off-road segments with this treatment. The haul truck drivers shall be directed to drive on the paving or Composite Mat System exclusively unless there is no feasible alternative.

2.0 POLLUTANTS

Pollutants are generally classified as either criteria pollutants or non-criteria pollutants. Federal ambient air quality standards have been established for criteria pollutants, whereas no ambient standards have been established for non-criteria pollutants. For some criteria pollutants, separate standards have been set for different periods. Most standards have been set to protect public health. For some pollutants, standards have been based on other values (such as protection of crops, protection of materials, or avoidance of nuisance conditions). A summary of federal and state ambient air quality standards is provided in the Regulatory Framework section.

2.1 Criteria Pollutants

The criteria pollutants consist of: ozone, nitrogen oxides, carbon monoxide, sulfur oxides, lead, and particulate matter. These pollutants can be harmful to human health and the environment, and cause property damage. The Environmental Protection Agency (EPA) calls these pollutants "criteria" air pollutants because it regulates them by developing human health-based and/or environmentally-based criteria for setting permissible levels. The following provides descriptions of each of the criteria pollutants.

Nitrogen Oxides

Nitrogen Oxides (NOx) is the generic term for a group of highly reactive gases which contain nitrogen and oxygen. While most NOx are colorless and odorless, concentrations of nitrogen dioxide (NO_2) can often be seen as a reddish-brown layer over many urban areas. NOx form when fuel is burned at high temperatures, as in a combustion process. The primary manmade sources of NO_x are motor vehicles, electric utilities, and other industrial, commercial, and residential sources that burn fuel. NOx reacts with other pollutants to form, ground-level ozone, nitrate particles, acid aerosols, as well as NO_2, which cause respiratory problems. NO_x and the pollutants formed from NO_x can be transported over long distances, following the patterns of prevailing winds. Therefore controlling NOx is often most effective if done from a regional perspective, rather than focusing on the nearest sources.

Ozone

Ozone is not usually emitted directly into the air but in the vicinity of ground-level is created by a chemical reaction between NOx and volatile organic compounds (VOC) in the presence of sunlight. Motor vehicle exhaust, industrial emissions, gasoline vapors, chemical solvents as well as natural sources emit NOx and VOC that help form ozone. Ground-level ozone is the primary constituent of smog. Sunlight and hot weather cause ground-level ozone to form with the greatest concentrations usually occurring downwind from urban areas. Ozone is subsequently considered a regional pollutant. Ground-level ozone is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections and can cause substantial damage to vegetation and other materials. Because NOx and VOC are ozone precursors, the health effects associated with ozone are also indirect health effects associated with significant levels of NOx and VOC emissions.

Carbon Monoxide

Carbon monoxide (CO) is a colorless, odorless gas that is formed when carbon in fuel is not burned completely. It is a component of motor vehicle exhaust, which contributes approximately 56 percent of all CO emissions nationwide. In cities, 85 to 95 percent of all CO emissions may come from motor vehicle exhaust. Other sources of CO emissions include industrial processes (such as metals processing and chemical manufacturing), residential wood burning, and natural sources such as forest fires. Woodstoves, gas stoves, cigarette smoke, and unvented gas and kerosene space heaters are indoor sources of CO. The highest levels of CO in the outside air typically occur during the colder months of the year when inversion conditions are more frequent. The air pollution becomes trapped near the ground beneath a layer of warm

air. CO is described as having only a local influence because it dissipates quickly. Since CO concentrations are strongly associated with motor vehicle emissions, high CO concentrations generally occur in the immediate vicinity of roadways with high traffic volumes and traffic congestion, active parking lots, and in automobile tunnels. Areas adjacent to heavily traveled and congested intersections are particularly susceptible to high CO concentrations.

CO is a public health concern because it combines readily with hemoglobin and thus reduces the amount of oxygen transported in the bloodstream. The health threat from lower levels of CO is most serious for those who suffer from heart disease such as angina, clogged arteries, or congestive heart failure. For a person with heart disease, a single exposure to CO at low levels may cause chest pain and reduce that person's ability to exercise; repeated exposures may contribute to other cardiovascular effects. High levels of CO can affect even healthy people. People who breathe high levels of CO can develop vision problems, reduced ability to work or learn, reduced manual dexterity, and difficulty performing complex tasks. At extremely high levels, CO is poisonous and can cause death.

Sulfur Oxides

Sulfur Oxide (SOx) gases are formed when fuel containing sulfur, such as coal and oil is burned, as well as from the refining of gasoline. SOx dissolves easily in water vapor to form acid and interacts with other gases and particles in the air to form sulfates and other products that can be harmful to people and the environment.

Lead

Lead is a metal found naturally in the environment as well as manufactured products. The major sources of lead emissions have historically been motor vehicles and industrial sources. Due to the phase out of leaded gasoline, metal processing is now the primary source of lead emissions to the air. High levels of lead in the air are typically only found near lead smelters, waste incinerators, utilities, and lead-acid battery manufacturers. Exposure of fetuses, infants and children to low levels of Pb can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased lead levels are associated with increased blood pressure.

Particulate Matter

Particle matter (PM) is the term for a mixture of solid particles and liquid droplets found in the air. PM is made up of a number of components including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. The size of particles is directly linked to their potential for causing health problems. Particles that are less than 10 micrometers in diameter (PM10) are the particles that generally pass through the throat and nose and enter the lungs. Once inhaled, these particles can affect the heart and lungs and cause serious health effects. Particles that are less than 2.5 micrometers in diameter (PM2.5) have been designated as a subset of PM10 due to their increased negative health impacts and its ability to remain suspended in the air longer and travel further.

2.2 Toxic Air Contaminants

Toxic air contaminants (TACs) is a term that is defined under the California Clean Air Act and consists of the same substances that are defined as Hazardous Air Pollutants (HAPs) in the Federal Clean Air Act. There are over 700 hundred different types of TACs with varying degrees of toxicity. Sources of TACs include industrial processes such as petroleum refining and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust. Cars and trucks release at least 40 different toxic air contaminants. The most important of these TACs, in terms of health risk, are diesel particulates, benzene, formaldehyde, 1,3-butadiene, and acetaldehyde. Public exposure to TACs can

result from emissions from normal operations as well as from accidental releases. Health effects of TACs include cancer, birth defects, neurological damage, and death.

Diesel Particulate Matter

According to *The California Almanac of Emissions and Air Quality 2013 Edition*, the majority of the estimated health risk from TACs can be attributed to relatively few compounds, the most important of which is diesel particulate matter (DPM). DPM is a subset of PM2.5 because the size of diesel particles are typically 2.5 microns and smaller. The identification of DPM as a TAC in 1998 led the California Air Resources Board (CARB) to adopt the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-fueled Engines and Vehicles in September 2000. The plan's goals are a 75-percent reduction in DPM by 2010 and an 85-percent reduction by 2020 from the 2000 baseline. The various pollutants within DPM that also cause acute and chronic health impacts are detailed below in Table A. Table A was developed through crosschecking all diesel emissions pollutants provided in *2010 California Toxic Inventory in Tons per Year,* prepared by CARB, November 2013 to the list of acute and chronic reference exposure levels provided at: http://oehha.ca.gov/air/allrels.html.

Table A – Diesel Emission Pollutants that Cause Acute and Chronic Health Impacts

TAC	Acute (A) or Chronic (C)	Diesel Weight Fraction[1]	Target Organ Systems
Acetaldehyde	A and C	0.0735	Eyes, respiratory system (sensory irritation)
Acrolein	A and C	0.003	Eyes, respiratory system
Arsenic	A and C	0.000002	Reproductive/developmental, cardiovascular system, nervous system
Benzene	A and C	0.02	Hematologic system, immune system, reproductive/developmental
Cadmium	C		kidney, respiratory system
Chlorine	A and C	0.00003	Eyes, respiratory system
Chromium (hexavalent)	C		Respiratory system, hematologic system
Copper	A	0.00006	Respiratory system
Ethyl benzene	C		Liver, kidney, developmental
Formaldehyde	A and C	0.1471	Eyes, immune system, respiratory
Hexane	C		Nervous system
Manganese	C		Nervous system
Mercury	A and C	0.000006	Reproductive/developmental
Methanol	A and C	0.0408	Nervous system, developmental
Methyl Ethyl Ketone	A	0.0148	Eyes, respiratory system
Naphthalene	C		Respiratory system
Nickel	A and C	0.000008	Immune system, respiratory system
Propylene	C		Respiratory System
Selenium	C		Liver, cardiovascular system, nervous system
Styrene	A and C	0.0006	Eyes, respiratory system, reproductive/development
Toluene	A and C	0.0147	Nervous system, eyes, respiratory system, reproduction/developmental
Vanadium	A	0.001	Eyes, respiratory system
Xylene	A and C	0.0104	Eyes, nervous and respiratory systems

Notes:
[1] Diesel related TAC composition is based on the CARB speciation profile 6099 for PM and 818 for VOC.
Sources: CARB, 2013 and OEHHA, 2014.

Diesel engines emit a complex mixture of air pollutants, composed of gaseous and solid material. The visible emissions in diesel exhaust are known as particulate matter or PM, which includes carbon particles or "soot." Diesel exhaust also contains a variety of harmful gases and over 40 other cancer-causing substances. California's identification of DPM as a toxic air contaminant was based on its potential to cause cancer, premature deaths, and other health problems. Exposure to DPM is a health hazard, particularly to children whose lungs are still developing and the elderly who may have other serious health problems. Overall, diesel engine emissions are responsible for the majority of California's potential airborne cancer risk from combustion sources.

Asbestos

Asbestos is listed as a TAC by CARB and as a Hazardous Air Pollutant by the EPA. Asbestos occurs naturally in mineral formations and crushing or breaking these rocks, through construction or other means, can release asbestiform fibers into the air. Asbestos emissions can result from the sale or use of asbestos-containing materials, road surfacing with such materials, grading activities, and surface mining. The risk of disease is dependent upon the intensity and duration of exposure. When inhaled, asbestos fibers may remain in the lungs and with time may be linked to such diseases as asbestosis, lung cancer, and mesothelioma. The nearest likely locations of naturally occurring asbestos, as identified in the *General Location Guide for Ultramafic Rocks in California*, prepared by the California Division of Mines and Geology, is located approximately 70 miles northwest of the project site in Santa Barbara County. Due to the distance to the nearest natural occurrences of asbestos, the project site is not likely to contain asbestos.

2.3 Greenhouse Gases

Constituent gases of the Earth's atmosphere, called atmospheric greenhouse gases (GHGs), play a critical role in the Earth's radiation amount by trapping infrared radiation from the Earth's surface, which otherwise would have escaped to space. Prominent greenhouse gases contributing to this process include carbon dioxide (CO_2), methane (CH_4), ozone (O_3), water vapor, nitrous oxide (N_2O), and chlorofluorocarbons (CFCs). This phenomenon, known as the Greenhouse Effect, is responsible for maintaining a habitable climate. Anthropogenic (caused or produced by humans) emissions of these greenhouse gases in excess of natural ambient concentrations are responsible for the enhancement of the Greenhouse Effect and have led to a trend of unnatural warming of the Earth's natural climate, known as global warming or climate change. Emissions of gases that induce global warming are attributable to human activities associated with industrial/manufacturing, agriculture, utilities, transportation, and residential land uses. Transportation is responsible for 41 percent of the State's greenhouse gas emissions, followed by electricity generation. Emissions of CO_2 and N_2O are byproducts of fossil fuel combustion. Methane, a potent greenhouse gas, results from off-gassing associated with agricultural practices and landfills. Sinks of CO_2, where CO_2 is stored outside of the atmosphere, include uptake by vegetation and dissolution into the ocean. The following provides a description of each of the greenhouse gases and their global warming potential.

Water Vapor

Water vapor is the most abundant, important, and variable GHG in the atmosphere. Water vapor is not considered a pollutant; in the atmosphere it maintains a climate necessary for life. Changes in its concentration are primarily considered a result of climate feedbacks related to the warming of the atmosphere rather than a direct result of industrialization. The feedback loop in which water is involved is critically important to projecting future climate change. As the temperature of the atmosphere rises, more water is evaporated from ground storage (rivers, oceans, reservoirs, soil). Because the air is warmer, the relative humidity can be higher (in essence, the air is able to "hold" more water when it is warmer), leading to more water vapor in the atmosphere. As a GHG, the higher concentration of water vapor is then able to absorb more thermal indirect energy radiated from the Earth, thus further warming the atmosphere. The warmer atmosphere can then hold more water vapor and so on and so on. This is referred to as a "positive

feedback loop." The extent to which this positive feedback loop will continue is unknown as there is also dynamics that put the positive feedback loop in check. As an example, when water vapor increases in the atmosphere, more of it will eventually also condense into clouds, which are more able to reflect incoming solar radiation (thus allowing less energy to reach the Earth's surface and heat it up).

Carbon Dioxide

The natural production and absorption of CO_2 is achieved through the terrestrial biosphere and the ocean. However, humankind has altered the natural carbon cycle by burning coal, oil, natural gas, and wood. Since the industrial revolution began in the mid 1700s, each of these activities has increased in scale and distribution. CO_2 was the first GHG demonstrated to be increasing in atmospheric concentration with the first conclusive measurements being made in the last half of the 20th century. Prior to the industrial revolution, concentrations were fairly stable at 280 parts per million (ppm). The International Panel on Climate Change (IPCC) indicates that concentrations were 379 ppm in 2005, an increase of more than 30 percent. Left unchecked, the IPCC projects that concentration of carbon dioxide in the atmosphere is projected to increase to a minimum of 540 ppm by 2100 as a direct result of anthropogenic sources. This could result in an average global temperature rise of at least two degrees Celsius or 3.6 degrees Fahrenheit.

Methane

CH_4 is an extremely effective absorber of radiation, although its atmospheric concentration is less than that of CO_2. Its lifetime in the atmosphere is brief (10 to 12 years), compared to some other GHGs (such as CO_2, N_2O, and Chlorofluorocarbons (CFCs)). CH_4 has both natural and anthropogenic sources. It is released as part of the biological processes in low oxygen environments, such as in swamplands or in rice production (at the roots of the plants). Over the last 50 years, human activities such as growing rice, raising cattle, using natural gas, and mining coal have added to the atmospheric concentration of methane. Other anthropocentric sources include fossil-fuel combustion and biomass burning.

Nitrous Oxide

Concentrations of N_2O also began to rise at the beginning of the industrial revolution. In 1998, the global concentration of this GHG was documented at 314 parts per billion (ppb). N_2O is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. N_2O is also commonly used as an aerosol spray propellant (i.e., in whipped cream bottles, in potato chip bags to keep chips fresh, and in rocket engines and race cars).

Chlorofluorocarbons

CFCs are gases formed synthetically by replacing all hydrogen atoms in methane or ethane (C_2H_6) with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at the Earth's surface). CFCs have no natural source, but were first synthesized in 1928. They were used for refrigerants, aerosol propellants, and cleaning solvents. Due to the discovery that they are able to destroy stratospheric ozone, a global effort to halt their production was undertaken and in 1989 the European Community agreed to ban CFCs by 2000 and subsequent treaties banned CFCs worldwide by 2010. This effort was extremely successful, and the levels of the major CFCs are now remaining level or declining. However, their long atmospheric lifetimes mean that some of the CFCs will remain in the atmosphere for over 100 years.

Hydrofluorocarbons

HFCs are synthetic man-made chemicals that are used as a substitute for CFCs. Out of all the GHGs, they are one of three groups with the highest global warming potential. The HFCs with the largest measured

atmospheric abundances are (in order), HFC-23 (CHF_3), HFC-134a (CF_3CH_2F), and HFC-152a (CH_3CHF_2). Prior to 1990, the only significant emissions were HFC-23. HFC-134a use is increasing due to its use as a refrigerant. Concentrations of HFC-23 and HFC-134a in the atmosphere are now about 10 parts per trillion (ppt) each. Concentrations of HFC-152a are about 1 ppt. HFCs are manmade for applications such as automobile air conditioners and refrigerants.

Perfluorocarbons

Perfluorocarbons (PFCs) have stable molecular structures and do not break down through the chemical processes in the lower atmosphere. High-energy ultraviolet rays about 60 kilometers above Earth's surface are able to destroy the compounds. Because of this, PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane (CF_4) and hexafluoroethane (C_2F_6). Concentrations of CF_4 in the atmosphere are over 70 ppt. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing.

Sulfur Hexafluoride

Sulfur Hexafluoride (SF_6) is an inorganic, odorless, colorless, nontoxic, nonflammable gas. SF_6 has the highest global warming potential of any gas evaluated; 23,900 times that of CO_2. Concentrations in the 1990s were about 4 ppt. Sulfur hexafluoride is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.

Aerosols

Aerosols are particles emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light. Cloud formation can also be affected by aerosols. Sulfate aerosols are emitted when fuel containing sulfur is burned. Black carbon (or soot) is emitted during biomass burning due to the incomplete combustion of fossil fuels. Particulate matter regulation has been lowering aerosol concentrations in the United States; however, global concentrations are likely increasing.

2.4 Global Warming Potential

GHGs have varying global warming potential (GWP). The GWP is the potential of a gas or aerosol to trap heat in the atmosphere; it is the cumulative radiative forcing effects of a gas over a specified time horizon resulting from the emission of a unit mass of gas relative to the reference gas, CO_2. The GHGs listed by the IPCC and the CEQA Guidelines are discussed in this section in order of abundance in the atmosphere. Water vapor, the most abundant GHG, is not included in this list because its natural concentrations and fluctuations far outweigh its anthropogenic (human-made) sources. To simplify reporting and analysis, GHGs are commonly defined in terms of their GWP. The IPCCC defines the GWP of various GHG emissions on a normalized scale that recasts all GHG emissions in terms of CO_2e. The GWP of CO_2 is by definition, 1. The GWP values used in this analysis are based on the IPCC Second Assessment Report (SAR) and United Nations Framework Convention on Climate Change (UNFCCC) reporting guidelines, and are detailed on the following page in Table B. The SAR GWPs are used in CARB's California inventory and AB32 Scoping Plan estimates. The SAR GWPs are used in CARB's California inventory and AB32 Scoping Plan estimates.

Table B – Global Warming Potentials, Atmospheric Lifetimes and Abundances of GHGs

Gas	Atmospheric Lifetime (years)[1]	Global Warming Potential (100 Year Horizon)[2]	Atmospheric Abundance
Carbon Dioxide (CO_2)	50-200	1	379 ppm
Methane (CH_4)	9-15	25	1,774 ppb
Nitrous Oxide (N_2O)	114	298	319 ppb
HFC-23	270	14,800	18 ppt
HFC-134a	14	1,430	35 ppt
HFC-152a	1.4	124	3.9 ppt
PFC: Tetrafluoromethane (CF_4)	50,000	7,390	74 ppt
PFC: Hexafluoroethane (C_2F_6)	10,000	12,200	2.9 ppt
Sulfur Hexafluoride (SF_6)	3,200	22,800	5.6 ppt

Notes:
[1] Defined as the half-life of the gas.
[2] Compared to the same quantity of CO_2 emissions and is based on the Intergovernmental Panel On Climate Change (IPCC) 2007 standard, which is utilized in CalEEMod (Version 2016.3.1),that is used in this report (CalEEMod user guide: Appendix A).
Definitions: ppm = parts per million; ppb = parts per billion; ppt = parts per trillion

3.0 AIR QUALITY MANAGEMENT

3.1 Regulatory Setting

The air quality at the project site is addressed through the efforts of various international, federal, state, regional, and local government agencies. These agencies work jointly, as well as individually, to improve air quality through legislation, regulations, planning, policy-making, education, and a variety of programs. The agencies responsible for improving the air quality are discussed below.

International

In 1988, the United Nations established the Intergovernmental Panel on Climate Change (IPCC) to evaluate the impacts of global climate change and to develop strategies that nations could implement to curtail global climate change. In 1992, the United States joined other countries around the world in signing the United Nations' Framework Convention on Climate Change (UNFCCC) agreement with the goal of controlling GHG emissions. The parties of the UNFCCC adopted the Kyoto Protocol, which set binding GHG reduction targets for 37 industrialized countries, the objective of reducing their collective GHG emissions by five percent below 1990 levels by 2012. The Kyoto Protocol has been ratified by 182 countries, but has not been ratified by the United States. It should be noted that Japan and Canada opted out of the Kyoto Protocol and the remaining developed countries that ratified the Kyoto Protocol have not met their Kyoto targets. The Kyoto Protocol expired in 2012 and the amendment for the second commitment period from 2013 to 2020 has not yet entered into legal force. The Parties to the Kyoto Protocol negotiated the Paris Agreement in December 2015, agreeing to set a goal of limiting global warming to less than 2 degrees Celsius compared with pre-industrial levels. The Paris Agreement has been adopted by 195 nations with 147 ratifying it, including the United States by President Obama, who ratified it by Executive Order on September 3, 2016. On June 1, 2017, President Trump announced that the United States is withdrawing from the Paris Agreement, however the Paris Agreement is still legally binding by the other remaining nations.

Additionally, the Montreal Protocol was originally signed in 1987 and substantially amended in 1990 and 1992. The Montreal Protocol stipulates that the production and consumption of compounds that deplete ozone in the stratosphere—CFCs, halons, carbon tetrachloride, and methyl chloroform—were to be phased out, with the first three by the year 2000 and methyl chloroform by 2005.

Federal – United States Environmental Protection Agency

The United States Environmental Protection Agency (EPA) is responsible for setting and enforcing the National Ambient Air Quality Standards (NAAQS) for atmospheric pollutants. It regulates emission sources that are under the exclusive authority of the federal government, such as aircraft, ships, and certain locomotives. NAAQS pollutants were identified using medical evidence and are shown on the following page in Table C.

As part of its enforcement responsibilities, the EPA requires each state with federal nonattainment areas to prepare and submit a State Implementation Plan (SIP) that demonstrates the means to attain the national standards. The SIP must integrate federal, state, and local components and regulations to identify specific measures to reduce pollution, using a combination of performance standards and market-based programs within the timeframe identified in the SIP.

Table C – State and Federal Criteria Pollutant Standards

Air Pollutant	Concentration / Averaging Time		Most Relevant Effects
	California Standards	Federal Primary Standards	
Ozone (O_3)	0.09 ppm / 1-hour 0.07 ppm / 8-hour	0.070 ppm, / 8-hour	(a) Pulmonary function decrements and localized lung edema in humans and animals; (b) Risk to public health implied by alterations in pulmonary morphology and host defense in animals; (c) Increased mortality risk; (d) Risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures and pulmonary function decrements in chronically exposed humans; (e) Vegetation damage; and (f) Property damage.
Carbon Monoxide (CO)	20.0 ppm / 1-hour 9.0 ppm / 8-hour	35.0 ppm / 1-hour 9.0 ppm / 8-hour	(a) Aggravation of angina pectoris and other aspects of coronary heart disease; (b) Decreased exercise tolerance in persons with peripheral vascular disease and lung disease; (c) Impairment of central nervous system functions; and (d) Possible increased risk to fetuses.
Nitrogen Dioxide (NO_2)	0.18 ppm / 1-hour 0.030 ppm / annual	100 ppb / 1-hour 0.053 ppm / annual	(a) Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups; (b) Risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes; and (c) Contribution to atmospheric discoloration.
Sulfur Dioxide (SO_2)	0.25 ppm / 1-hour 0.04 ppm / 24-hour	75 ppb / 1-hour 0.14 ppm/annual	(a) Bronchoconstriction accompanied by symptoms which may include wheezing, shortness of breath and chest tightness, during exercise or physical activity in persons with asthma.
Suspended Particulate Matter (PM_{10})	50 µg/m^3 / 24-hour 20 µg/m^3 / annual	150 µg/m^3 / 24-hour	(a) Exacerbation of symptoms in sensitive patients with respiratory or cardiovascular disease; (b) Declines in pulmonary function growth in children; and (c) Increased risk of premature death from heart or lung diseases in elderly.
Fine Suspended Particulate Matter ($PM_{2.5}$)	12 µg/m^3 / annual	35 µg/m^3 / 24-hour 12 µg/m^3 / annual	
Sulfates	25 µg/m^3 / 24-hour	No Federal Standards	(a) Decrease in ventilatory function; (b) Aggravation of asthmatic symptoms; (c) Aggravation of cardio-pulmonary disease; (d) Vegetation damage; (e) Degradation of visibility; and (f) Property damage.
Lead	1.5 µg/m^3 / 30-day	0.15 µg/m^3 /3-month rolling	(a) Learning disabilities; and (b) Impairment of blood formation and nerve conduction.
Visibility Reducing Particles	Extinction coefficient of 0.23 per kilometer - visibility of ten miles or more due to particles when relative humidity is less than 70 percent.	No Federal Standards	Visibility impairment on days when relative humidity is less than 70 percent.

Source: http://www.arb.ca.gov/research/aaqs/aaqs2.pdf .

The CARB defines attainment as the category given to an area with no violations in the past three years. As indicated below in Table D, the Air Basin has been designated by EPA for the national standards as a non-attainment area for ozone (O_3) and suspended particulates (PM10 and PM2.5) and partial non-

attainment for lead. Currently, the Air Basin is in attainment with the national ambient air quality standards for carbon monoxide (CO), sulfur dioxide (SO_2), and nitrogen dioxide (NO_2).

Table D – South Coast Air Basin Attainment Status

Criteria Pollutant	Standard	Averaging Time	Designation[a)]	Attainment Date[b)]
1-Hour Ozone	NAAQS	1979 1-Hour (0.12 ppm)	Nonattainment (Extreme)	2/6/2023 Originally 11/15/2010 (not attained)[c)]
	CAAQS	1-Hour (0.09 ppm)	Nonattainment	N/A
8-Hour Ozone[d)]	NAAQS	1997 8-Hour (0.08 ppm)	Nonattainment (Extreme)	6/15/2024
	NAAQS	2008 8-Hour (0.075 ppm)	Nonattainment (Extreme)	7/20/2032
	NAAQS	2015 8-Hour (0.070 ppm)	Designations Pending	~2037
	CAAQS	8-Hour (0.070 ppm)	Nonattainment	Beyond 2032
CO	NAAQS	1-Hour (35 ppm) 8-Hour (9 ppm)	Attainment (Maintenance)	6/11/2007 (attained)
	CAAQS	1-Hour (20 ppm) 8-Hour (9 ppm)	Attainment	6/11/2007 (attained)
NO_2[e)]	NAAQS	1-Hour (0.10 ppm)	Unclassifiable/ Attainment	N/A (attained)
	NAAQS	Annual (0.053 ppm)	Attainment (Maintenance)	9/22/1998 (attained)
	CAAQS	1-Hour (0.18 ppm) Annual (0.030 ppm)	Attainment	---
SO_2[f)]	NAAQS	1-Hour (75 ppb)	Designations Pending (expect Unclassifiable/ Attainment)	N/A (attained)
	NAAQS	24-Hour (0.14 ppm) Annual (0.03 ppm)	Unclassifiable/ Attainment	3/19/1979 (attained)
PM10	NAAQS	1987 24-hour (150 µg/m^3)	Attainment (Maintenance)[g)]	7/26/2013 (attained)
	CAAQS	24-hour (50 µg/m^3) Annual (20 µg/m^3)	Nonattainment	N/A
PM2.5[h)]	NAAQS	2006 24-Hour (35 µg/m^3)	Nonattainment (Serious)	12/31/2019
	NAAQS	1997 Annual (15.0 µg/m^3)	Nonattainment	4/5/2015
	NAAQS	2012 Annual (12.0 µg/m^3)	Nonattainment (Serious)	12/31/2025
	CAAQS	Annual (12.0 µg/m^3)	Nonattainment	N/A
Lead	NAAQS	3-Months Rolling (0.15 µg/m^3)	Nonattainment (Partial)	12/31/2015

Source: SCAQMD, February 2016

Notes:

a) U.S. EPA often only declares Nonattainment areas; everywhere else is listed as Unclassifiable/Attainment or Unclassifiable

b) A design value below the NAAQS for data through the full year or smog season prior to the attainment date is typically required for attainment demonstration

c) 1-hour O_3 standard (0.12 ppm) was revoked, effective June 15, 2005; however, the Basin has not attained this standard based on 2008-2010 data and is still subject to anti-backsliding requirements

d) 1997 8-hour O_3 standard (0.08 ppm) was reduced (0.075 ppm), effective May 27, 2008; the revoked 1997 O_3 standard is still subject to anti-backsliding requirements

e) New NO_2 1-hour standard, effective August 2, 2010; attainment designations January 20, 2012; annual NO2 standard retained

f) The 1971 annual and 24-hour SO_2 standards were revoked, effective August 23, 2010; however, these 1971 standards will remain in effect until one year after U.S. EPA promulgates area designations for the 2010 SO_2 1-hour standard. Area designations are still pending, with Basin

expected to be designated Unclassifiable /Attainment.
g) Annual PM10 standard was revoked, effective December 18, 2006; 24-hour PM10 NAAQS deadline was 12/31/2006; SCAQMD request for attainment redesignation and PM10 maintenance plan was approved by U.S. EPA on June 26, 2013, effective July 26, 2013.
h) Attainment deadline for the 2006 24-Hour PM2.5 NAAQS (designation effective December 14, 2009) is December 31, 2019 (end of the 10th calendar year after effective date of designations for Serious nonattainment areas). Annual PM2.5 standard was revised on January 15, 2013, effective March 18, 2013, from 15 to 12 $\mu g/m^3$. Designations effective April 15, 2015, so Serious area attainment deadline is December 31, 2025.
i) Partial Nonattainment designation – Los Angeles County portion of Basin only for near-source monitors. Expect to remain in attainment based on current monitoring data.

In 2015, one or more stations in the Air Basin exceeded the most current federal standards on a total of 146 days (40 percent of the year), including: 8-hour ozone (113 days over 2015 ozone NAAQS), 24-hour PM2.5 (30 days, including near-road sites; 25 days for ambient sites only), PM10 (2 days), and NO_2 (1 day). Despite substantial improvement in air quality over the past few decades, some air monitoring stations in the Air Basin still exceed the NAAQS for ozone more frequently than any other area in the United States. Seven of the top 10 stations in the nation most frequently exceeding the 2015 8-hour ozone NAAQS in 2015 were located within the Air Basin, including stations in San Bernardino, Riverside, and Los Angeles Counties.

PM2.5 levels in the Air Basin have improved significantly in recent years. By 2013 and again in 2014 and 2015, there were no stations measuring PM2.5 in the Air Basin that violated the former 1997 annual PM2.5 NAAQS (15.0 $\mu g/m^3$) for the 3-year design value period. On July 25, 2016 the EPA finalized a determination that the Basin attained the 1997 annual (15.0 $\mu g/m^3$) and 24-hour PM2.5 (65 $\mu g/m^3$) NAAQS, effective August 24, 2016. Of the 17 federal PM2.5 monitors at ambient stations in the Air Basin for the 2013-2015 period, five stations had design values over the current 2012 annual PM2.5 NAAQS (12.0 $\mu g/m^3$), including: Mira Loma (Air Basin maximum at 14.1 $\mu g/m^3$), Rubidoux, Fontana, Ontario, Central Los Angeles, and Compton. For the 24-hour PM2.5 NAAQS (35.0 $\mu g/m^3$) there were 14 stations in the Air Basin in 2015 that had one or more daily exceedances of the standard, with a combined total of 25 days over that standard in the Air Basin. While it was previously anticipated that the Air Basin's 24-hour PM2.5 NAAQS would be attained by 2015, this did not occur based on the data for 2013 through 2015. The higher number of days exceeding the 24-hour PM2.5 NAAQS over what was expected is largely attributed to the severe drought conditions over this period that allowed for more stagnant conditions in the Air Basin with multi-day buildups of higher PM2.5 concentrations. This was caused by the lack of storm-related dispersion and rain-out of PM and its precursors.

The South Coast Air Basin is currently in attainment for the federal standards for SO_2, CO, and NO_2. While the concentration level of the new 1-hour NO_2 federal standard (100 ppb) was exceeded in the South Coast Air Basin for one day in 2015 (Long Beach-Hudson Station), the NAAQS NO_2 design value has not been exceeded. Therefore, the South Coast Air Basin remains in attainment of the NO_2 NAAQS.

The EPA designated the Los Angeles County portion of the South Coast Air Basin as nonattainment for the recently revised (2008) federal lead standard (0.15 $\mu g/m^3$, rolling 3-month average), due to the addition of source-specific monitoring under the new federal regulation. This designation was based on two source-specific monitors in Vernon and the City of Industry exceeding the new standard in the 2007-2009 period of data used. For the most recent 2009-2011 data period, only one of these stations (Vernon) still exceeded the lead standard. The *2012 Lead State Implementation Plan Los Angeles County*, prepared by SCAQMD and adopted on May 4, 2012, provides measures to meet attainment of lead by December 31, 2015. Current monitoring data shows that lead is now below the standards at all monitoring stations, however it will take three years of meeting the standards before Los Angeles County can request to be re-designated by the EPA.

In Massachusetts v. Environmental Protection Agency (Docket No. 05–1120), argued November 29, 2006 and decided April 2, 2007, the U.S. Supreme Court held that not only did the EPA have authority to regulate greenhouse gases, but the EPA's reasons for not regulating this area did not fit the statutory requirements. As such, the U.S. Supreme Court ruled that the EPA should be required to regulate CO2 and other greenhouse gases as pollutants under the federal Clean Air Act (CAA).

In response to the FY2008 Consolidations Appropriations Act (H.R. 2764; Public Law 110-161), EPA proposed a rule on March 10, 2009 that requires mandatory reporting of GHG emissions from large sources in the United States. On September 22, 2009, the Final Mandatory Reporting of GHG Rule was signed and published in the Federal Register on October 30, 2009. The rule became effective on December 29, 2009. This rule requires suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more per year of GHG emissions to submit annual reports to EPA.

On December 7, 2009, the EPA Administrator signed two distinct findings under section 202(a) of the Clean Air Act. One is an endangerment finding that finds concentrations of the six GHGs in the atmosphere threaten the public health and welfare of current and future generations. The other is a cause or contribute finding, that finds emissions from new motor vehicles and new motor vehicle engines contribute to the GHG pollution which threatens public health and welfare. These actions will not themselves impose any requirements on industry or other entities, however, since 2009 the EPA has been providing GHG emission standards for vehicles and other stationary sources of GHG emissions that are regulated by the EPA. On September 13, 2013 the EPA Administrator signed 40 CFR Part 60, that limits emissions from new sources to 1,100 pounds of CO_2 per MWh for fossil fuel-fired utility boilers and 1,000 pounds of CO_2 per MWh for large natural gas-fired combustion units.

On August 3, 2015, the EPA announced the Clean Power Plan, emissions guidelines for U.S. states to follow in developing plans to reduce GHG emissions from existing fossil fuel-fired power plants (Federal Register Vol. 80, No. 205, October 23 2015). On February 9, 2016 the Supreme Court stayed implementation of the Clean Power Plan due to a legal challenge from 29 states and in April 2017, the Supreme Court put the case on a 60 day hold and directed both sides to make arguments for whether it should keep the case on hold indefinitely or close it and remand the issue to the EPA. On October 11, 2017, the EPA issued a formal proposal to repeal the Clean Power Plan, however the repeal of the Plan will require following the same rule-making system used to create regulations and will likely result in court challenges.

State – California Air Resources Board

The California Air Resources Board (CARB), which is a part of the California Environmental Protection Agency, is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, the CARB conducts research, sets the California Ambient Air Quality Standards (CAAQS), compiles emission inventories, develops suggested control measures, provides oversight of local programs, and prepares the SIP. The CAAQS for criteria pollutants are shown above in Table C. In addition, the CARB establishes emission standards for motor vehicles sold in California, consumer products (e.g. hairspray, aerosol paints, and barbeque lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions.

The South Coast Air Basin has been designated by the CARB as a non-attainment area for ozone, PM10, and PM2.5. Currently, the South Coast Air Basin is in attainment with the ambient air quality standards for CO, NO_2, SO_2, lead, and sulfates and is unclassified for visibility reducing particles and Hydrogen Sulfide.

On December 12, 2008 the CARB adopted Resolution 08-43, which limits NOx, PM10 and PM2.5 emissions from on-road diesel truck fleets that operate in California. On October 12, 2009 Executive Order

R-09-010 was adopted that codified Resolution 08-43 into Section 2025, title 13 of the California Code of Regulations. This regulation requires that by the year 2023 all commercial diesel trucks that operate in California shall meet model year 2010 (Tier 4 Final) or latter emission standards. In the interim period, this regulation provides annual interim targets for fleet owners to meet. This regulation also provides a few exemptions including a onetime per year 3-day pass for trucks registered outside of California.

CARB is also responsible for regulations pertaining to Toxic Air Contaminants (TACs). The Air Toxics "Hot Spots" Information and Assessment Act (Assembly Bill [AB] 2588, 1987, Connelly) was enacted in 1987 as a means to establish a formal air toxics emission inventory risk quantification program. AB 2588, as amended, establishes a process that requires stationary sources to report the type and quantities of certain substances their facilities routinely release in California. The data is ranked by high, intermediate, and low categories, which are determined by: the potency, toxicity, quantity, volume, and proximity of the facility to nearby receptors.

CARB also proposed interim statewide CEQA thresholds for GHG emissions and released *Recommended Approaches for Setting Interim Significance Thresholds for Greenhouse Gases under the California Environmental Quality Act,* on October 24, 2008. The State currently has no regulations that establish ambient air quality standards for GHGs. However, the State has passed laws directing CARB to develop actions to reduce GHG emissions, which are listed below.

Executive Order B-30-15, Senate Bill 32 and Assembly Bill 197

The California Governor issued Executive Order B-30-15 on April 29, 2015 that aims to reduce California's GHG emissions 40 percent below 1990 levels by 2030. This executive order aligns California's GHG reduction targets with those of other international governments, such as the European Union that set the same target for 2030 in October, 2014. This target will make it possible to reach the ultimate goal of reducing GHG emissions 80 percent under 1990 levels by 2050 that is based on scientifically established levels needed in the U.S.A to limit global warming below 2 degrees Celsius – the warming threshold at which scientists say there will likely be major climate disruptions such as super droughts and rising sea levels. Assembly Bill 197 (AB 197) (September 8, 2016) and Senate Bill 32 (SB 32) (September 8, 2016) codified into statute the GHG emissions reduction targets of at least 40 percent below 1990 levels by 2030 as detailed in EO B-30-15. AB 197 also requires additional GHG emissions reporting that is broken down to sub-county levels and requires CARB to consider the social costs of emissions impacting disadvantaged communities.

Executive Order B-29-15

The California Governor issued Executive Order B-29-15 on April 1, 2015 and directed the State Water Resources Control Board to impose restrictions to achieve a statewide 25% reduction in urban water usage and directed the Department of Water Resources to replace 50 million square feet of lawn with drought tolerant landscaping through an update to the State's Model Water Efficient Landscape Ordinance. The Ordinance also requires installation of more efficient irrigation systems, promotion of greywater usage and onsite stormwater capture, and limits the turf planted in new residential landscapes to 25 percent of the total area and restricts turf from being planted in median strips or in parkways unless the parkway is next to a parking strip and a flat surface is required to enter and exit vehicles. Executive Order B-29-15 would reduce GHG emissions associated with the energy used to transport and filter water.

Assembly Bill 1493

California Assembly Bill 1493 (also known as the Pavley Bill, in reference to its author Fran Pavley) was enacted on July 22, 2002 and required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. In 2004, CARB approved the "Pavley I" regulations limiting

the amount of GHGs that may be released from new passenger automobiles that are being phased in between model years 2009 through 2016. These regulation will reduce GHG emissions by 30 percent from 2002 levels by 2016. The second set of regulations "Pavley II" is currently in development and will be phased in between model years 2017 through 2025 and will reduce emissions by 45 percent by the year 2020. The Pavley II standards are being developed by linking the GHG emissions and formerly separate toxic tailpipe emissions standards previously known as the "LEV III" (third stage of the Low Emission Vehicle standards) into a single regulatory framework. The new rules reduce emissions from gasoline-powered cars as well as promote zero-emissions auto technologies such as electricity and hydrogen, and through increasing the infrastructure for fueling hydrogen vehicles. In 2009, the U.S. EPA granted California the authority to implement the GHG standards for passenger cars, pickup trucks and sport utility vehicles. In September 2009, the Pavley I regulations were adopted by CARB.

Executive Order S-3-05

The California Governor issued Executive Order S 3-05, GHG Emission, in June 2005, which established the following reduction targets:

- 2010: Reduce greenhouse gas emissions to 2000 levels;
- 2020: Reduce greenhouse gas emissions to 1990 levels;
- 2050: Reduce greenhouse gas emissions to 80 percent below 1990 levels.

The executive order directed the secretary of the California Environmental Protection Agency (CalEPA) to coordinate a multi-agency effort to reduce GHG emissions to the target levels. To comply with the Executive Order, the secretary of CalEPA created the California Climate Action Team (CAT), made up of members from various state agencies and commissions. The team released its first report in March 2006. The report proposed to achieve the targets by building on the voluntary actions of businesses, local governments, and communities and through State incentive and regulatory programs. The State achieved its first goal of reducing greenhouse gas emissions to 2000 levels by 2010.

Assembly Bill 32

In 2006, the California State Legislature adopted Assembly Bill 32 (AB 32), the California Global Warming Solutions Act of 2006. AB 32 requires CARB, to adopt rules and regulations that would achieve GHG emissions equivalent to statewide levels in 1990 by 2020 through an enforceable statewide emission cap which will be phased in starting in 2012. Emission reductions shall include carbon sequestration projects that would remove carbon from the atmosphere and utilize best management practices that are technologically feasible and cost effective.

On December 6, 2007 CARB released the calculated Year 1990 GHG emissions of 427 million metric tons of CO2e ($MMTCO_2e$). The 2020 target of 427 $MMTCO_2e$ requires the reduction of 169 $MMTCO_2e$, or approximately 30 percent from the State's projected 2020 business as usual emissions of 596 $MMTCO_2e$ and the reduction of 42 $MMTCO_2e$, or almost 10 percent from the 2002-2004 average GHG emissions. Under AB 32, CARB was required to adopt regulations by January 1, 2011 to achieve reductions in GHGs to meet the 1990 cap by 2020. Early measures CARB took to lower GHG emissions included requiring operators of the largest industrial facilities that emit 25,000 metric tons of CO2 in a calendar year to submit verification of GHG emissions by December 1, 2010. The CARB Board also approved nine discrete early action measures that include regulations affecting landfills, motor vehicle fuels, refrigerants in cars, port operations and other sources, all of which became enforceable on or before January 1, 2010.

CARB's Scoping Plan that was adopted in 2009, proposes a variety of measures including: strengthening energy efficiency and building standards; targeted fees on water and energy use; a market-based cap-and-

trade system; achieving a 33 percent renewable energy mix; and a fee regulation to fund the program. The 2014 update to the Scoping Plan identifies strategies moving beyond the 2020 targets to the year 2050.

The Cap and Trade Program established under the Scoping Plan sets a statewide limit on sources responsible for 85 percent of California's GHG emissions, and has established a market for long-term investment in energy efficiency and cleaner fuels since 2012.

Senate Bill 1368

Senate Bill 1368 (SB 1368) is the companion Bill of AB 32 and was adopted September 2006. SB 1368 requires that the California Public Utilities Commission (CPUC) establish a performance standard for baseload generation of GHG emissions by investor-owned utilities by February 1, 2007 and for local publicly owned utilities by June 30, 2007. These standards could not exceed the GHG emissions rate from a baseload combined-cycle, natural gas-fired plant. Furthermore, the legislation states that all electricity provided to the State, including imported electricity, must be generated by plants that meet the standards set by CPUC and California Energy Commission (CEC).

Executive Order S-1-07

Executive Order S-1-07 was issued in 2007 and proclaims that the transportation sector is the main source of GHG emissions in the State, since it generates more than 40 percent of the State's GHG emissions. It establishes a goal to reduce the carbon intensity of transportation fuels sold in the State by at least ten percent by 2020. This Order also directs CARB to determine whether this Low Carbon Fuel Standard (LCFS) could be adopted as a discrete early-action measure as part of the effort to meet the mandates in AB 32.

In 2009 CARB approved the proposed regulation to implement the low carbon fuel standard. The standard was challenged in the courts, but has been in effect since 2011 and was re-approved by the CARB in 2015. The low carbon fuel standard is anticipated to reduce GHG emissions by about 16 MMT per year by 2020. The low carbon fuel standard is designed to provide a framework that uses market mechanisms to spur the steady introduction of lower carbon fuels. The framework establishes performance standards that fuel producers and importers must meet annually. Reformulated gasoline mixed with corn-derived ethanol and low-sulfur diesel fuel represent the baseline fuels. Lower carbon fuels may be ethanol, biodiesel, renewable diesel, or blends of these fuels with gasoline or diesel. Compressed natural gas and liquefied natural gas also may be low-carbon fuels. Hydrogen and electricity, when used in fuel cells or electric vehicles, are also considered as low-carbon fuels.

Senate Bill 97

Senate Bill 97 (SB 97) was adopted August 2007 and acknowledges that climate change is a prominent environmental issue that requires analysis under CEQA. SB 97 directed the Governor's Office of Planning and Research (OPR), which is part of the State Natural Resources Agency, to prepare, develop, and transmit to CARB guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions, as required by CEQA, by July 1, 2009. The Natural Resources Agency was required to certify and adopt those guidelines by January 1, 2010.

Pursuant to the requirements of SB 97 as stated above, on December 30, 2009 the Natural Resources Agency adopted amendments to the State CEQA guidelines that address GHG emissions. The CEQA Guidelines Amendments changed 14 sections of the CEQA Guidelines and incorporated GHG language throughout the Guidelines. However, no GHG emissions thresholds of significance were provided and no specific mitigation measures were identified. The GHG emission reduction amendments went into effect on March 18, 2010 and are summarized below:

- Climate action plans and other greenhouse gas reduction plans can be used to determine whether a project has significant impacts, based upon its compliance with the plan.
- Local governments are encouraged to quantify the greenhouse gas emissions of proposed projects, noting that they have the freedom to select the models and methodologies that best meet their needs and circumstances. The section also recommends consideration of several qualitative factors that may be used in the determination of significance, such as the extent to which the given project complies with state, regional, or local GHG reduction plans and policies. OPR does not set or dictate specific thresholds of significance. Consistent with existing CEQA Guidelines, OPR encourages local governments to develop and publish their own thresholds of significance for GHG impacts assessment.
- When creating their own thresholds of significance, local governments may consider the thresholds of significance adopted or recommended by other public agencies, or recommended by experts.
- New amendments include guidelines for determining methods to mitigate the effects of greenhouse gas emissions in Appendix F of the CEQA Guidelines.
- OPR is clear to state that "to qualify as mitigation, specific measures from an existing plan must be identified and incorporated into the project; general compliance with a plan, by itself, is not mitigation."
- OPR's emphasizes the advantages of analyzing GHG impacts on an institutional, programmatic level. OPR therefore approves tiering of environmental analyses and highlights some benefits of such an approach.
- Environmental impact reports (EIRs) must specifically consider a project's energy use and energy efficiency potential.

Senate Bills 1078, 107, and X1-2 and Executive Orders S-14-08 and S-21-09

Senate Bill 1078 (SB 1078) requires retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20 percent of their supply from renewable sources by 2017. Senate Bill 107 (SB 107) changed the target date to 2010. Executive Order S-14-08 was signed on November 2008 and expands the State's Renewable Energy Standard to 33 percent renewable energy by 2020. Executive Order S-21-09 directed CARB to adopt regulations by July 31, 2010 to enforce S-14-08. Senate Bill X1-2 codifies the 33 percent renewable energy requirement by 2020.

Senate Bill 375

Senate Bill 375 (SB 375) was adopted September 2008 and aligns regional transportation planning efforts, regional GHG emission reduction targets, and land use and housing allocation. SB 375 requires Metropolitan Planning Organizations (MPO) to adopt a sustainable communities strategy (SCS) or alternate planning strategy (APS) that will prescribe land use allocation in that MPOs Regional Transportation Plan (RTP). CARB, in consultation with each MPO, will provide each affected region with reduction targets for GHGs emitted by passenger cars and light trucks in the region for the years 2020 and 2035. These reduction targets are required to be updated every eight years and in June 2017 CARB released *Staff Report Proposed Update to the SB 375 Greenhouse Gas Emission Reduction Target*, which provides recommended GHG emissions reduction targets for SCAG of 8 percent by 2020 and 21 percent by 2035.

The *2016-2040 Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS), adopted by SCAG April, 2016 provides a 2020 GHG emission reduction target of 8 percent and a 2035 GHG emission reduction target of 18 percent. SCAG will need to develop additional strategies in its next revision of the

RTP/SCS in order to meet CARB's new 21 percent GHG emission reduction target for 2035. CARB is also charged with reviewing SCAG's RTP/SCS for consistency with its assigned targets.

City and County land use policies, including General Plans, are not required to be consistent with the RTP and associated SCS or APS. However, new provisions of CEQA would incentivize, through streamlining and other provisions, qualified projects that are consistent with an approved SCS or APS and categorized as "transit priority projects."

Assembly Bill 341 and Senate Bills 939 and 1374

Senate Bill 939 (SB 939) requires that each jurisdiction in California to divert at least 50 percent of its waste away from landfills, whether through waste reduction, recycling or other means. Senate Bill 1374 (SB 1374) requires the California Integrated Waste Management Board to adopt a model ordinance by March 1, 2004 suitable for adoption by any local agency to require 50 to 75 percent diversion of construction and demolition of waste materials from landfills. Assembly Bill 341 (AB 341) was adopted in 2011 and builds upon the waste reduction measures of SB 939 and 1374, and sets a new target of a 75 percent reduction in solid waste generated by the year 2020.

California Code of Regulations (CCR) Title 24, Part 11

CCR Title 24, Part 11: *California Green Building Standards* (Title 24) was developed in response to continued efforts to reduce GHG emissions associated with energy consumption. The most current version is the 2013 California Green Building Standards Code (CalGreen), which became effective on January 1, 2014 and replaced the 2010 CalGreen. One focus of CCR Title 24, Part 11 is water conservation measures, which reduce GHG emissions by reducing electrical consumption associated with pumping and treating water. CCR Title 24, Part 11 has approximately 52 nonresidential mandatory measures and an additional 130 provisions for optional use. Some key mandatory measures for commercial occupancies include specified parking for clean air vehicles, a 20 percent reduction of potable water use within buildings through use of low-flow fixtures, a 50 percent construction waste diversion from landfills, and use of building finish materials that emit low levels of volatile organic compounds.

Regional

The SCAQMD is the agency principally responsible for comprehensive air pollution control in the South Coast Air Basin. To that end, as a regional agency, the SCAQMD works directly with the Southern California Association of Governments (SCAG), county transportation commissions, and local governments and cooperates actively with all federal and state agencies.

South Coast Air Quality Management District

SCAQMD develops rules and regulations, establishes permitting requirements for stationary sources, inspects emission sources, and enforces such measures through educational programs or fines, when necessary. SCAQMD is directly responsible for reducing emissions from stationary, mobile, and indirect sources. It has responded to this requirement by preparing a sequence of AQMPs. The *Final 2016 Air Quality Management Plan* (2016 AQMP) was adopted by the SCAQMD Board on March 3, 2016 and was adopted by CARB on March 23, 2017 for inclusion into the California State Implementation Plan (SIP). The 2016 AQMP was prepared in order to meet the following standards:

- 8-hour Ozone (75 ppb) by 2032
- Annual PM2.5 (12 µg/m3) by 2021-2025
- 8-hour Ozone (80 ppb) by 2024 (updated from the 2007 and 2012 AQMPs)
- 1-hour Ozone (120 ppb) by 2023 (updated from the 2012 AQMP)

- 24-hour PM2.5 (35 µg/m3) by 2019 (updated from the 2012 AQMP)

In addition to meeting the above standards, the 2016 AQMP will also include revisions to the attainment demonstrations for the 1997 8-hour ozone NAAQS and the 1979 1-hour ozone NAAQS. The prior 2012 AQMP was prepared in order to demonstrate attainment with the 24-hour PM2.5 standard by 2014 through adoption of all feasible measures. The prior 2007 AQMP demonstrated attainment with the 1997 8-hour ozone (80 ppb) standard by 2023, through implementation of future improvements in control techniques and technologies. These "black box" emissions reductions represent 65 percent of the remaining NOx emission reductions by 2023 in order to show attainment with the 1997 8-hour ozone NAAQS. Given the magnitude of these needed emissions reductions, additional NOx control measures have been provided in the 2012 AQMP even though the primary purpose was to show compliance with 24-hour PM2.5 emissions standards.

The 2016 AQMP provides a new approach that focuses on available, proven and cost effective alternatives to traditional strategies, while seeking to achieve multiple goals in partnership with other entities to promote reductions in GHG emissions and TAC emissions as well as efficiencies in energy use, transportation, and goods movement. The 2016 AQMP recognizes the critical importance of working with other agencies to develop funding and other incentives that encourage the accelerated transition of vehicles, buildings and industrial facilities to cleaner technologies in a manner that benefits not only air quality, but also local businesses and the regional economy.

Although SCAQMD is responsible for regional air quality planning efforts, it does not have the authority to directly regulate air quality issues associated with plans and new development projects throughout the South Coast Air Basin. Instead, this is controlled through local jurisdictions in accordance to the California Environmental Quality Act (CEQA). In order to assist local jurisdictions with air quality compliance issues the *CEQA Air Quality Handbook* (SCAQMD CEQA Handbook), prepared by SCAQMD, 1993, with the most current updates found at http://www.aqmd.gov/ceqa/hdbk.html, was developed in accordance with the projections and programs of the AQMP. The purpose of the SCAQMD CEQA Handbook is to assist Lead Agencies, as well as consultants, project proponents, and other interested parties in evaluating a proposed project's potential air quality impacts. Specifically, the SCAQMD CEQA Handbook explains the procedures that SCAQMD recommends be followed for the environmental review process required by CEQA. The SCAQMD CEQA Handbook provides direction on how to evaluate potential air quality impacts, how to determine whether these impacts are significant, and how to mitigate these impacts. The SCAQMD intends that by providing this guidance, the air quality impacts of plans and development proposals will be analyzed accurately and consistently throughout the South Coast Air Basin, and adverse impacts will be minimized.

SCAQMD Working Group

Since neither CARB nor the OPR has developed GHG emissions threshold, the SCAQMD formed a Working Group to develop significance thresholds related to GHG emissions. At the September 28, 2010 Working Group meeting, the SCAQMD released its most current version of the draft GHG emissions thresholds, which recommends a tiered approach that either provides a quantitative annual thresholds of 3,500 $MTCO_2e$ for residential uses, 1,400 $MTCO_2e$ for commercial uses, and 3,000 $MTCO_2e$ for mixed uses. An alternative annual threshold of 3,000 $MTCO_2e$ for all land use types is also proposed.

Southern California Association of Governments

The SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and addresses regional issues relating to transportation, the economy, community development and the environment. SCAG is the federally designated Metropolitan Planning Organization (MPO) for the majority of the southern California region and is the largest MPO in the nation. With respect

to air quality planning, SCAG has prepared the RTP/SCS and *Regional Transportation Improvement Plan* (RTIP), which addresses regional development and growth forecasts. These plans form the basis for the land use and transportation components of the AQMP, which are utilized in the preparation of air quality forecasts and in the consistency analysis included in the AQMP. The RTP/SCS, RTIP, and AQMP are based on projections originating within the City and County General Plans.

Local – City of Los Angeles

Local jurisdictions, such as the City of Los Angeles, have the authority and responsibility to reduce air pollution through its police power and decision-making authority. Specifically, the City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. The City is also responsible for the implementation of transportation control measures as outlined in the 2007 AQMP and 2012 AQMP. Examples of such measures include bus turnouts, energy-efficient streetlights, and synchronized traffic signals. In accordance with CEQA requirements and the CEQA review process, the City assesses the air quality impacts of new development projects, requires mitigation of potentially significant air quality impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation.

In accordance with the CEQA requirements, the City does not, however, have the expertise to develop plans, programs, procedures, and methodologies to ensure that air quality within the City and region will meet federal and state standards. Instead, the City relies on the expertise of the SCAQMD and utilizes the SCAQMD CEQA Handbook as the guidance document for the environmental review of plans and development proposals within its jurisdiction.

4.0 ATMOSPHERIC SETTING

4.1 Local Climate

The project site is located within the western central portion of Los Angeles County, which is part of the South Coast Air Basin that includes all of Orange County as well as the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. The South Coast Air Basin is located on a coastal plain with connecting broad valleys and low hills to the east. Regionally, the South Coast Air Basin is bounded by the Pacific Ocean to the southwest and high mountains to the east forming the inland perimeter. The project site is located toward the northwest portion of the South Coast Air Basin near the foot of the San Gabriel Mountain range, which defines the northern boundary of the South Coast Air Basin.

The climate of the western central portion of Los Angeles County, technically called an interior valley subclimate of the Southern California's Mediterranean-type climate, is characterized by hot dry summers, mild moist winters with infrequent rainfall, moderate afternoon breezes, and generally fair weather. Occasional periods of strong Santa Ana winds and winter storms interrupt the otherwise mild weather pattern. The clouds and fog that form along the area's coastline rarely extend as far inland as central Los Angeles County. When morning clouds and fog form, they typically burn off quickly after sunrise. The most important weather pattern from an air quality perspective is associated with the warm season airflow across the populated areas of the South Coast Air Basin. This airflow brings polluted air into central Los Angeles County late in the afternoon. This transport pattern creates unhealthful air quality that may extend to the project site particularly during the summer months.

Winds are an important parameter in characterizing the air quality environment of a project site because they both determine the regional pattern of air pollution transport and control the rate of dispersion near a source. Daytime winds in central Los Angeles County are usually light breezes from off the coast as air moves regionally onshore from the cool Pacific Ocean to the warm Mojave Desert interior of Southern California. These winds allow for good local mixing, but as discussed above, these coastal winds carry significant amounts of industrial and automobile air pollutants from the densely urbanized western portion of the South Coast Air Basin into the interior valleys which become trapped by the mountains that border the eastern edge of the South Coast Air Basin.

In the summer, strong temperature inversions may occur that limit the vertical depth through which air pollution can be dispersed. Air pollutants concentrate because they cannot rise through the inversion layer and disperse. These inversions are more common and persistent during the summer months. Over time, sunlight produces photochemical reactions within this inversion layer that creates ozone, a particularly harmful air pollutant. Occasionally, strong thermal convections occur which allows the air pollutants to rise high enough to pass over the mountains and ultimately dilute the smog cloud.

In the winter, light nocturnal winds result mainly from the drainage of cool air off of the mountains toward the valley floor while the air aloft over the valley remains warm. This forms a type of inversion known as a radiation inversion. Such winds are characterized by stagnation and poor local mixing and trap pollutants such as automobile exhaust near their source. Despite light wind conditions, especially at night and in the early morning, winter is generally a period of good air quality in the project vicinity.

The temperature and precipitation levels for San Fernando, which is the nearest monitoring station to the project site, is shown on the following page in Table E. Table E shows that July is typically the warmest month and January is typically the coolest month. Rainfall in the project area varies considerably in both time and space. Almost all the annual rainfall comes from the fringes of mid-latitude storms from late November to early April, with summers being almost completely dry.

Table E – San Fernando Monthly Climate Data

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Average Max. Temperature	65.0	66.8	70.1	74.7	78.5	84.4	92.4	92.2	88.9	81.1	73.4	66.1
Average Min. Temperature	42.9	43.3	43.9	46.5	49.6	52.4	56.1	56.3	54.4	50.7	47.6	44.6
Average Total Precipitation (in.)	3.78	3.46	2.71	1.49	0.39	0.39	0.02	0.03	0.17	0.52	1.73	2.96

4.2 Monitored Local Air Quality

The air quality at any site is dependent on the regional air quality and local pollutant sources. Regional air quality is determined by the release of pollutants throughout the air South Coast Air Basin. Estimates of the existing emissions in SCAB provided in the 2012 AQMP, indicate that collectively, mobile sources account for 59 percent of the VOC, 88 percent of the NOx emissions and 40 percent of directly emitted PM2.5, with another 10 percent of PM2.5 from road dust. The 2016 AQMP found that since 2012 AQMP projections were made, stationary source VOC emissions have decreased by approximately 12 percent, but mobile VOC emissions have increased by 5 percent. The percentage of NOx emissions remain unchanged between the 2012 and 2016 projections.

SCAQMD has divided the South Coast Air Basin into 38 air-monitoring areas with a designated ambient air monitoring station representative of each area. The project site is located in air monitoring area 7, which is located in East San Fernando Valley and covers the area from the Hollywood Hills to San Fernando. The nearest air monitoring station to the project site is the Burbank West Palm Avenue Monitoring Station (Burbank Station), which is located approximately six miles southeast of the project site at 228 W. Palm Avenue, Burbank. However, it should be noted that due to the air monitoring station's distance from the project site, recorded air pollution levels at the Burbank Station reflect with varying degrees of accuracy, local air quality conditions at the project site. It should also be noted that no monitoring data is available for the Burbank Station after 2014, so the three years of data provided are from 2012, 2013, and 2014.

Table F on page 31 presents the monitored pollutant levels from the Burbank Station. The monitoring data presented in Table F shows that ozone and particulate matter (PM10 and PM2.5) are the air pollutants of primary concern in the project area, which are detailed below:

Ozone

During the last three years, the State 1-hour concentration standard for ozone has been exceeded between 0 and 8 days each year at the Burbank Station. The State 8-hour ozone standard has been exceeded between 2 and 17 days each year over the past three years at the Burbank Station. The Federal 8-hour ozone standard was exceeded between 1 and 8 days each year over the past three years at the Burbank Station.

Ozone is a secondary pollutant as it is not directly emitted. Ozone is the result of chemical reactions between other pollutants, most importantly hydrocarbons (VOC) and NO_2, which occur only in the presence of bright sunlight. Pollutants emitted from upwind cities react during transport downwind to produce the oxidant concentrations experienced in the area. Many areas of Southern California contribute to the ozone levels experienced at this monitoring station, with the more significant areas being those directly upwind.

Table F – Local Area Air Quality Monitoring Summary

Pollutant (Standard)	Year[1] 2012	2013	2014
Ozone:			
Maximum 1-Hour Concentration (ppm)	0.117	0.110	0.091
Days > CAAQS (0.09 ppm)	**8**	**4**	0
Maximum 8-Hour Concentration (ppm)	0.088	0.083	0.079
Days > NAAQS (0.075 ppm)	**8**	**6**	**1**
Days > CAAQs (0.070 ppm)	**17**	**17**	**2**
Carbon Monoxide:			
Maximum 1-Hour Concentration (ppm)	2.8	2.4	--*
Days > NAAQS and CAAQS (20 ppm)	0	0	--*
Maximum 8-Hour Concentration (ppm)	2.35	--*	--*
Days > NAAQS and CAAQS (9 ppm)	0	--*	--*
Nitrogen Dioxide:			
Maximum 1-Hour Concentration (ppb)	79.5	72.4	73.2
Days > NAAQS (100 ppb)	0	0	0
Sulfur Dioxide:			
Maximum 24-Hour Concentration (ppm)	0.002	0.002	--*
Days > CAAQS (0.04 ppm)	0	0	0
Inhalable Particulates (PM10):			
Maximum 24-Hour California Measurement (ug/m^3)	55.0	53.3	68.6
Days > NAAQS (150 ug/m^3)	0	0	0
Days > CAAQS (50 ug/m^3)	1	1	1
Annual Arithmetic Mean (AAM) (ug/m^3)	26.4	25.8	28.8
Annual > NAAQS (50 ug/m^3)	No	No	No
Annual > CAAQS (20 ug/m^3)	**Yes**	**Yes**	**Yes**
Fine Particulates (PM2.5):			
Maximum 24-Hour National Measurement (ug/m^3)	54.2	45.1	64.6
Days > NAAQS (35 ug/m^3)	**2**	**4**	**2**
Annual Arithmetic Mean (AAM) (ug/m^3)	12.2	12.2	12.2
Annual > NAAQS and CAAQS (12 ug/m^3)	**Yes**	**Yes**	**Yes**

Notes: Exceedances are listed in **bold.** CAAQS = California Ambient Air Quality Standard; NAAQS = National Ambient Air Quality Standard; ppm = parts per million; ppb = parts per billion.
[1] Data obtained from the Burbank Station.
* Insufficient or no data.
Source: http://www.arb.ca.gov/adam/

Carbon Monoxide

CO is another important pollutant that is due mainly to motor vehicles. The Burbank Station, did not record an exceedance of the state or federal 1-hour or 8-hour CO standards for the last three years. It should be noted that CO is currently in attainment in the South Coast Air Basin and that monitoring of CO within the South Coast Air Basin ended on March 31, 2013.

Nitrogen Dioxide

The Burbank Station did not record an exceedance of the Federal 1-hour NO_2 standard for the last three years.

Sulfur Dioxide

The Burbank Station, did not record an exceedance of the state 24-hour SO_2 standards for the last three years.

Particulate Matter

The State 24-hour concentration standard for PM10 has been exceeded by one day each year over the past three years at the Burbank Station. Over the past three years the Federal 24-hour standard for PM10 has not been exceeded at the Burbank Station. The annual PM10 concentration at the Burbank Station has exceeded the State standard for the past three years and has not exceeded the Federal standard for the past three years.

Over the past three years the Federal 24-hour concentration standard for PM2.5 has been exceeded between 2 and 4 days each year over the past three years at the Burbank Station. The annual PM2.5 concentration at the Burbank Station has exceeded both the State and Federal standard for the past three years. There does not appear to be a noticeable trend for PM10 or PM2.5 in either maximum particulate concentrations or days of exceedances in the area. Particulate levels in the area are due to natural sources, grading operations, and motor vehicles.

4.3 Toxic Air Contaminant Levels in the South Coast Air Basin

In order to determine the South Coast Air Basin-wide risks associated with major airborne carcinogens, the SCAQMD conducted the Multiple Air Toxics Exposure Study (MATES) studies. According to the SCAQMD's MATES-III study, the northern portion of the project site has an estimated cancer risk of 630 in one million chance of cancer and the southern portion of the project site has an estimated cancer risk of 749 in one million chance of cancer. In comparison, the average cancer risk for the SCAQMD portion of Los Angeles County is 912 in one million. The primary sources of TACs in the study area are from diesel emissions from trucks operating on State Route 170 and Interstate 5.

In order to provide a perspective of risk, it is often estimated that the incidence in cancer over a lifetime for the U.S. population will affect 25 percent of all persons, or a risk of about 250,000 per million persons. The MATES-III study referenced a Harvard Report on Cancer Prevention, which estimated that of cancers associated with known risk factors, about 30 percent were related to tobacco, about 30 percent were related to diet and obesity, and about 2 percent were associated with environmental pollution related exposures that includes hazardous air pollutants.

5.0 MODELING PARAMETERS AND ASSUMPTIONS

5.1 Criteria Pollutant Emissions

Typical emission rates from construction activities were obtained from CalEEMod Version 2016.3.1. CalEEMod is a computer model published by the SCAQMD for estimating air pollutant emissions. The CalEEMod program uses the EMFAC2014 computer program to calculate the emission rates specific for Los Angeles County for construction-related employee vehicle trips and the OFFROAD2011 computer program to calculate emission rates for heavy truck operations. EMFAC2014 and OFFROAD2011 are computer programs generated by CARB that calculates composite emission rates for vehicles. Emission rates are reported by the program in grams per trip and grams per mile or grams per running hour. The proposed project was analyzed in the CalEEMod model based on 169 acres of User Defined Industrial land use.

Onsite Equipment Emissions

Construction activities have been analyzed as occurring over one phase of construction, that would start in 2018 and would last for approximately 20 months. According to the project applicant, the onsite equipment would consist of the simultaneous operation of two bulldozers, two excavators, one sediment shaker/sifter, three water trucks, and one street sweeper. The bulldozers, excavators, and sediment shaker were modeled as operating eight hours per day and the water trucks and street sweeper were modeled as operating four hours per day. Either a mounted impact hammer or hoe-ram would also be utilized during the demolition of the existing intake structure, however the hoe-ram would most likely be mounted on an excavator that has been accounted for above, so no separate equipment was modelled for the hoe-ram. The mitigation of water all exposed areas three times per day was chosen in order to account for the fugitive dust reduction that would occur through adhering to SCAQMD Rule 403, which requires that the Best Available Control Measures be utilized to reduce fugitive dust emissions.

Worker Trip Emissions

The *Traffic Impact Study Pacoima Spreading Grounds Improvement Project* (Traffic Study), prepared by Linscott Law & Greenspan, July, 2017, found that the proposed project would generate approximately 18 worker trips per day to the Pacoima Spreading Grounds. The 18 worker trips per day were analyzed under the construction emissions analysis in the CalEEMod model.

Demolition Truck Trip Emissions

The proposed project would include the removal of approximately 614 cubic yards of concrete from the removal of the existing intake canal. The demolished concrete would most likely be hauled to Sunshine Canyon Landfill. The removal of 614 cubic yards of concrete were accounted for in CalEEMod under Material Exported for the analyzed grading phase. This resulted in generating a total of 77 haul truck trips traveling 8 miles to Sunshine Canyon Landfill (The demolition truck trips to Sunshine Canyon Landfill would utilize Interstate 5, which is longer than Devonshire to Interstate 405).

Haul Truck Trip Emissions

The proposed project would require approximately 1.37 million cubic yards of sediment to be exported from the site to either Boulevard Pit, Sheldon Pit, or Cal-Mat Pit, or a combination of the sites. The Traffic Study and project applicant found that the export of sediment would generate either 478 daily 14-cubic yard haul trip truck trips or 372 daily 18-cubic yard haul trip truck trips, based on operating 5 days a week for 18 months. Emissions from both the 14-cubic yard haul trucks trips and the 18-cubic yard haul truck trips have been calculated in order to determine the impacts from both alternatives. The haul truck trip emissions were analyzed as operational emissions in the CalEEMod model because it is not possible to specify the type of haul truck in the construction emission analysis portion of the CalEEMod model. The CalEEMod

model printouts for the 14-cubic yard haul truck analysis is provided in Appendix A and the CalEEMod model printouts for the 18-cubic yard haul truck analysis is provided in Appendix B for the unmitigated conditions and Appendix C for the mitigated conditions.

For the 14-cubic yard haul truck analysis, the vehicle trips were set to 2.83 trips per acre for the 169 acre site, which results in 478 haul truck trips per day. For the 18-cubic yard haul truck analysis, the vehicle trips were set to 2.20 trips per acre for the 169 acre site, which results in 37 haul truck trips per day. The trip type was set to 100 percent Primary Trips in the CalEEMod model and the nonresidential commercial to commercial (C-C) trips were set to 100 percent to represent the haul truck trips. The travel distance was calculated through utilization of the haul route distances and ratios provided above in Section 1.3, for the worst-case condition where the Boulevard Pit is not utilized that results in an average haul truck length of 6.9 miles.

The fleet mix in the CalEEMod model was revised to 100 percent medium-heavy duty trucks for the 14-cubic yard haul truck analysis and 100 percent heavy-heavy duty trucks for the 18-cubic yard haul truck analysis. According to the County of Los Angeles Department of Public Works, an average of an eighth mile of each haul truck trip would occur on a dirt road on the project site. In order to account for the fugitive dust emissions that would occur from dirt road travel the CalEEMod model was set to 98.4 percent paved roads with unpaved roads with a moisture content of 12 percent and a mean vehicle speed of 15 miles per hour.

5.2 Toxic Air Contaminant Emissions

The on-going operation of the proposed project would generate toxic air contaminant (TAC) emissions from diesel truck and equipment emissions created during construction activities associated with the proposed project. The proposed project's TAC emissions have been analyzed for the area of the spreading basins and the truck routes within a quarter mile of the spreading basins. The analysis area was limited to the area around the spreading basins, since that is the only area where all of the haul truck routes and off-road equipment would operate in close proximity to each other and provides a worst-case analysis of the anticipated impacts along all haul routes.

Important issues that affect the dispersion modeling of TAC emissions include the following: 1) Model Selection, 2) Source Treatment, 3) Meteorological Data, and 4) Receptor Grid. Each of these issues is addressed below.

Model Selection

The AERMOD View Version 9.4.0 Model was used for all dispersion modeling. Key dispersion modeling options selected include the regulatory default option and urban modeling option based on a population of 9,862,049 for Los Angeles County. Flagpole receptor height was set to 0 meters. For each analysis area the AERMOD model was run twice, once for PM10 emissions and once for total organic gases, which includes VOC emissions in order to calculate both the cancer and non-cancer acute and chronic health risks. AERMAP (the terrain pre-processor for AERMOD) was run using a 1 degree USGS DEM Map of Los Angeles.

Source Treatment

The proposed project would consist of intake structure improvements, removal of sediment and reconfiguration of the spreading basins. The proposed improvements would require the use of diesel powered off-road equipment as well as diesel powered haul trucks, whose emissions sources have been analyzed separately below.

The construction activities will be limited to an 8-hour window between 9:00 a.m. and 5:30 p.m., however since the AERMOD model only allows for analyses to be segmented by 1-hour periods, the analysis was based on being operational between 9:00 a.m. and 5:00 p.m. Monday through Friday.

Onsite Diesel Equipment

According to the project applicant, the onsite equipment during construction activities would consist of the simultaneous operation of two bulldozers, two excavators, three water trucks, and one street sweeper. The PM10 and VOC equipment exhaust emissions have been calculated through use of the CalEEMod model detailed above in Section 5.1 for the criteria pollutant emissions analysis. The CalEEMod model utilizes the worst-case engine Tier level allowed under CARB's regulations for off-road diesel equipment. For the year 2018, the CalEEMod assumes that the onsite equipment will average at approximately a Tier 3 level, however that may be achieved with a mixture of Tier 0, 1, 2, 3, or 4 equipment. The CalEEMod model found that the onsite diesel equipment exhaust would create 2.42 pounds of PM10 per day and 4.90 pounds of VOC per day. The CalEEMod model printouts that detail these results are shown in Appendices A and B. The onsite diesel equipment has been modeled to operate between 9:00 a.m. and 5:00 p.m.. The onsite diesel equipment was modeled as six point sources located around the perimeter of the project site with unmitigated emission rates of 0.0064 grams of PM10 per second and 0.012 grams of VOC per second and a mitigated emission rate of 0.0021 grams of PM10 per second, which are based on dividing the total emissions by six. The equipment point sources were modeled with a 12.6 foot height, a 0.1 meter diameter, a velocity of 51.71 meters per second, and a temperature of 366 K.

Haul Trucks

The Traffic Study, found that the export of sediment would generate either 478 daily 14 cubic yard haul truck trips or 372 daily 18 cubic yard haul truck trips, based on operating 5 days a week for approximately 20 months. The onsite truck emissions have been analyzed separately for truck travel and truck idling.

Truck Travel

According to the project applicant, the location of the onsite loading of the haul trucks will be constantly changing on the project site, however efforts will be made to limit the use of the perimeter road for truck loading. In order, to provide a conservative analysis, the onsite diesel truck travel was modeled by using two line volume sources (one each on the north and south side of Devonshire Street within the spreading basins). The emission factors used for the roadway line volume sources was obtained from a model run of the web based version of EMFAC2014 for Los Angeles County at https://www.arb.ca.gov/emfac/2014 for the year 2018 for both a T6 instate construction heavy truck and a T7 Tractor construction truck traveling at 10 and 40 miles per hour. The EMFAC 2014 model results are shown in Table G and the EMFAC2014 model run printout is provided in Appendix D.

Table G – EMFAC 2014 Model Truck Running Emissions Rates

	PM10 Emission Rates (grams/mile)		TOG Emission Rates (grams/mile)	
Vehicle Category	**10 mph**	**40 mph**	**10 mph**	**40 mph**
T6 Instate Construction Heavy	0.0754	0.0241	0.6479	0.0800
T7 Tractor Construction	0.1138	0.0449	1.5016	0.1939

Source: https://www.arb.ca.gov/emfac/2014 for year 2018 in Los Angeles County.

The proposed project would either utilize 478 T6 trucks per day or 372 T7 trucks per day, which results in 22 percent more T6 trucks than T7 trucks. Since at 10 mph the T7 trucks produce 34 percent higher PM10 emissions than the T6 trucks, the T7 truck alternative would result in higher PM10 emissions and has been utilized in this analysis.

The onsite truck running emissions were analyzed as two line volume sources, with one on the north side of Devonshire Street and one on the south side of Devonshire Street. Each onsite road was based on a length of 200 meters, this resulted in emission rates of 3.1321E-04 grams per second of PM10 and 1.903E-03 grams per second of TOG for the onsite haul truck line sources, which is based on the haul trucks being operational for 8 hours per day, Monday through Friday. The onsite line sources were modeled with a 6 foot height and 12 foot width.

The truck travel on public roads was also modeled for Haul Routes A and B and Route C. Routes A and B are anticipated to have 61 percent of the haul trips or 227 T7 haul truck trips and was modeled as a line volume source from the middle of the project site on Devonshire Street to north on Arleta Avenue to north on Paxton Street to Interstate 5. Based on a road length of 1098 meters, this resulted in emission rates of 4.141E-04 grams per second of PM10 and 1.787E-03 grams per second of TOG for Routes A and B. Haul Route C is anticipated to have 39 percent of the haul trips or 145 T7 haul truck trips and was modeled as a line volume source from the middle of the of the project site on Devonshire Street to approximately a third mile west of the Spreading Grounds. Based on a road length of 942 meters, this resulted in emission rates of 2.272E-04 grams per second of PM10 and 9.803E-03 grams per second of TOG for Route C. The haul truck emissions rates are based on the haul trucks being operational for 8 hours per day, Monday through Friday. The offsite line sources were modeled with a 6 foot height and 40 foot width.

Truck Idling

The diesel truck idling was modeled as point sources. For the model run of the spreading basins, the truck idling was modeled based on two point sources with one placed in the central portion of the spreading basins located north of Devonshire Street and one placed in the central portion of the spreading basins located south of Devonshire Street. The analysis was based on half of the 372 daily truck trips idling for 7.5 minutes at each idling location. The emissions factor used for the truck idling point source was based on the EMFAC2014 version 1.0.7 Emission Rates, which details that for the year 2018 for T7 trucks produce 0.154 grams of PM10 per hour and 2.25 grams of TOG per hour. This results in a point source emissions rate of 1.2440E-04 grams per second of PM10 and 1.820E-03 grams per second of TOG for the haul truck idling point sources, which is based on the haul trucks operating 8 hour per day. The idling point sources were modeled with a 12.6 foot height, a 0.1 meter diameter, a velocity of 51.71 meters per second, and a temperature of 366 K.

Meteorological Data

Meteorological data from the SCAQMD's Burbank monitoring site was selected for this modeling application. Five full years of sequential meteorological data was collected at the Burbank Station from 2008 to 2012 by the SCAQMD. The SCAQMD processed the data for input to the model. The data was obtained at SCAQMD's website: http://www.aqmd.gov/home/library/air-quality-data-studies/meteorological-data/data-for-aermod.

Receptor Grid

The nearest sensitive receptors to the spreading basins that may be impacted by the proposed project are multi-family homes as near as 35 feet southwest of the proposed improvements to the spreading grounds, single-family homes as near as 40 feet north and west of the proposed improvements to the spreading grounds, and Devonwood Park located as near as 30 feet west of the proposed improvements to the spreading grounds. There are also single-family homes as near as 50 feet north of the intake canal improvements and single-family and multi-family homes as near as 25 feet from Haul Truck Routes A & B and single-family and multi-family homes as near as 40 feet from Haul Truck Route C on Devonshire Street. Discrete receptors were placed at the locations of the representative off-site residential structures and the park and grid receptors were used out to 500 meters (1,640 feet). The locations of the sources and receptors modeled in the AERMOD model is shown in Figure 3 on page 38.

Air Dispersion Model Source and Receptor Locations

6.0 AIR QUALITY STANDARDS

6.1 Regional Air Quality

Many air quality impacts that derive from dispersed mobile sources, which are the dominate pollution generators in the South Coast Air Basin, often occurs hours later and miles away after photochemical processes have converted primary exhaust pollutants into secondary contaminants such as ozone. The incremental regional air quality impact of an individual project is generally very small and difficult to measure. Therefore, SCAQMD has developed significance thresholds based on the volume of pollution emitted rather than on actual ambient air quality because the direct air quality impact of a project is not quantifiable on a regional scale. The SCAQMD CEQA Handbook states that any project in the South Coast Air Basin with daily emissions that exceed any of the identified significance thresholds should be considered as having an individually and cumulatively significant air quality impact. For the purposes to this air quality impact analysis, a regional air quality impact would be considered significant if emissions exceed the SCAQMD significance thresholds identified in Table H.

Table H – SCAQMD Regional Pollutant Emission Thresholds of Significance

	Pollutant Emissions (pounds/day)						
	VOC	**NOx**	**CO**	**SOx**	**PM10**	**PM2.5**	**Lead**
Construction	75	100	550	150	150	55	3
Operation	55	55	550	150	150	55	3

Source: http://www.aqmd.gov/ceqa/handbook/signthres.pdf

6.2 Local Air Quality

Project-related construction air emissions may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the South Coast Air Basin. In order to assess local air quality impacts the SCAQMD has developed Localized Significant Thresholds (LSTs) to assess the project-related air emissions in the project vicinity. SCAQMD has also provided *Final Localized Significance Threshold Methodology* (LST Methodology), July 2008, which details the methodology to analyze local air emission impacts. The LST Methodology found that the primary emissions of concern are NO_2, CO, PM10, and PM2.5.

The significance thresholds for the local emissions of NO_2 and CO are determined by subtracting the highest background concentration from the last three years of these pollutants from Table D above, from the most restrictive ambient air quality standards for these pollutants that are outlined in the LSTs. Since PM10 and PM2.5 currently exceed the most restrictive ambient air quality standards in the South Coast Air Basin, their thresholds have been directly based on the LSTs and therefore, background concentrations of PM10 and PM2.5 are not factored into the threshold. Table I below shows the LSTs for NO_2, CO, and PM10 and PM2.5 as well as the background concentrations and resultant significance concentrations.

Table I – SCAQMD Local Air Quality Thresholds of Significance for Construction

Pollutant	SCAQMD LSTs[1]	Background Level[2]	Significance Thresholds[3]
NO_2 - 1-Hour Average (State)	0.18 ppm (338 μg/m^3)	79.5 ppb (149 μg/m^3)	189 μg/m^3
CO - 1-Hour Average (State)	20 ppm (23,000 μg/m^3)	2.8 ppm (3,220 μg/m^3)	19,780 μg/m^3
CO - 8-Hour Average (State/Federal)	9.0 ppm (10,000 μg/m^3)	2.37 ppm (2,633 μg/m^3)	7,367 μg/m^3
PM10 - 24 Hour Average[4]	10.4 μg/m^3	--	10.4 μg/m^3
PM2.5 - 24-Hour Average[4]	10.4 μg/m^3	--	10.4 μg/m^3

Notes:
[1] Obtained from: http://www.aqmd.gov/ceqa/handbook/signthres.pdf.
[2] Obtained from Table D above and based on the highest measured concentrations from the last 3 years at the Burbank Station.
[3] Represents the maximum offsite concentrations allowed during operations.
[4] Based on SCAQMD Rule 403(d)(3).

6.3 Toxic Air Contaminants

According to the SCAQMD CEQA Handbook, any project that has the potential to expose the public to toxic air contaminants in excess of the following thresholds would be considered to have a significant air quality impact:

- If the Maximum Incremental Cancer Risk is 10 in one million or greater; or
- Toxic air contaminants from the proposed project would result in a Hazard Index increase of 1 or greater.

In order to determine if the proposed project may have a significant impact related to hazardous air pollutants (HAP), the *Health Risk Assessment Guidance for analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*, (Diesel Analysis) prepared by SCAQMD, August 2003, recommends that if the proposed project is anticipated to create HAPs through stationary sources or regular operations of diesel trucks on the project site, then the proximity of the nearest receptors to the source of the HAP and the toxicity of the HAP should be analyzed through a comprehensive facility-wide health risk assessment (HRA).

6.4 Odor Impacts

The SCAQMD CEQA Handbook states that an odor impact would occur if the proposed project creates an odor nuisance pursuant to SCAQMD Rule 402, which states:

> "A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.
>
> The provisions of this rule shall not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals."

The SCAQMD receives and investigates odor complaints from nearby residents and if six or more odor events are reported in a year the SCAQMD will consider the odor impact a nuisance and has the authority to require the offender to implement measures to reduce the odor impacts. If the proposed project results in a violation of Rule 402 with regards to odor impacts, then the proposed project would create a significant odor impact.

6.5 Greenhouse Gases

The proposed project is located within the jurisdiction of the SCAQMD. In order to identify significance criteria under CEQA for development projects, SCAQMD initiated a Working Group, which provided detailed methodology for evaluating significance under CEQA. At the September 28, 2010 Working Group meeting, the SCAQMD released its most current version of the draft GHG emissions thresholds, which recommends a tiered approach that provides a quantitative annual threshold of 3,000 $MTCO_2e$ for all land use types. Although the SCAQMD provided substantial evidence supporting the use of the above threshold, as of December 2016, the SCAQMD Board has not yet considered or approved the Working Group's thresholds.

It should be noted that SCAQMD's Working Group's thresholds were prepared prior to the issuance of Executive Order B-30-15 on April 29, 2015 that provided a reduction goal of 40 percent below 1990 levels by 2030. This target was codified into statute through passage of AB 197 and SB 32 in September 2016. However, to date no air district or local agency within California has provided guidance on how to address AB 197 and SB 32 with relation to land use projects. In addition, Cleveland v. SANDAG stated:

> SANDAG did not abuse its discretion in declining to adopt the 2050 goal as a measure of significance in light of the fact that the Executive Order does not specify any plan or implementation measures to achieve its goal. In its response to comments, the EIR said: "It is uncertain what role regional land use and transportation strategies can or should play in achieving the EO's 2050 emissions reduction target. A recent California Energy Commission report concludes, however, that the primary strategies to achieve this target should be major 'decarbonization' of electricity supplies and fuels, and major improvements in energy efficiency [citation].

Although, the above court case was referencing California's GHG emission targets for the year 2050, at this time it is also unclear what role land use strategies can or should play in achieving the AB 197 and SB 32 reduction goal of 40 percent below 1990 levels by 2030. As such this analysis has relied on the SCAQMD Working Group's recommended thresholds. Therefore, the proposed project would be considered to create a significant cumulative GHG impact if the proposed project would exceed the annual threshold of 3,000 $MTCO_2e$.

7.0 IMPACT ANALYSIS

7.1 CEQA Thresholds of Significance

Consistent with CEQA and the State CEQA Guidelines, a significant impact related to air quality and global climate change would occur if the proposed project is determined to result in:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors);
- Expose sensitive receptors to substantial pollutant concentrations;
- Create objectionable odors affecting a substantial number of people.
- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

7.2 Air Quality Compliance

The proposed project would not conflict with or obstruct implementation of the SCAQMD Air Quality Management Plan (AQMP). The following section discusses the proposed project's consistency with the SCAQMD AQMP.

SCAQMD Air Quality Management Plan

The California Environmental Quality Act (CEQA) requires a discussion of any inconsistencies between a proposed project and applicable general plans and regional plans (CEQA Guidelines Section 15125). The regional plan that applies to the proposed project includes the SCAQMD AQMP. Therefore, this section discusses any potential inconsistencies of the proposed project with the AQMP.

The purpose of this discussion is to set forth the issues regarding consistency with the assumptions and objectives of the AQMP and discuss whether the proposed project would interfere with the region's ability to comply with Federal and State air quality standards. If the decision-makers determine that the proposed project is inconsistent, the lead agency may consider project modifications or inclusion of mitigation to eliminate the inconsistency.

The SCAQMD CEQA Handbook states that "New or amended GP Elements (including land use zoning and density amendments), Specific Plans, and significant projects must be analyzed for consistency with the AQMP." Strict consistency with all aspects of the plan is usually not required. A proposed project should be considered to be consistent with the AQMP if it furthers one or more policies and does not obstruct other policies. The SCAQMD CEQA Handbook identifies two key indicators of consistency:

(1) Whether the project will result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.

(2) Whether the project will exceed the assumptions in the AQMP or increments based on the year of project buildout and phase.

Both of these criteria are evaluated in the following sections.

Criterion 1 - Increase in the Frequency or Severity of Violations?

Based on the air quality modeling analysis contained in this report, short-term regional construction air emissions would result in significant levels of NOx emissions that would exceed the SCAQMD regional thresholds of significance discussed in Section 6.1. Implementation of Mitigation Measure 1 would reduce this impact to less than significant levels. The localized analysis found that PM10 concentrations from onsite activities would exceed the SCAQMD local threshold of significance for construction activities. Implementation of Mitigation Measures 1 and 2 would reduce this impact to less than significant levels. This analysis also found that none of the other analyzed criteria pollutants would exceed the SCAQMD's regional emissions thresholds and would not exceed the local thresholds of significance discussed in Section 6.2. This analysis found the construction-related toxic air emissions would exceed the thresholds of significance discussed in Section 6.3. Mitigation Measure 1 would also reduce this impact to less than significant levels. The ongoing operation of the proposed project would not generate any additional air pollutant emissions. Therefore, based on the information provided above, with implementation of Mitigation Measures 1 and 2, the proposed project would be consistent with the first criterion.

Criterion 2 - Exceed Assumptions in the AQMP?

Consistency with the AQMP assumptions is determined by performing an analysis of the proposed project with the assumptions in the AQMP. The emphasis of this criterion is to insure that the analyses conducted for the proposed project are based on the same forecasts as the AQMP. The AQMP is developed through use of the planning forecasts provided in the RTP/SCS and FTIP. The RTP/SCS is a major planning document for the regional transportation and land use network within Southern California. The RTP/SCS is a long-range plan that is required by federal and state requirements placed on SCAG and is updated every four years. The FTIP provides long-range planning for future transportation improvement projects that are constructed with state and/or federal funds within Southern California. Local governments are required to use these plans as the basis of their plans for the purpose of consistency with applicable regional plans under CEQA. For this project, the City of Los Angeles Land Use Plan defines the assumptions that are represented in the AQMP.

The project site is currently designated as Open Space in the General Plan and is also zoned Open Space (OS-1XL-O). The proposed project would not change the current use as a spreading ground and is consistent with the current land use designation and zoning. Therefore, the proposed project would not result in an inconsistency with the current land use designation and zoning. Therefore, the proposed project is not anticipated to exceed the AQMP assumptions for the project site and is found to be consistent with the AQMP for the second criterion.

Based on the above, with implementation of Mitigation Measures 1 and 2, the proposed project will not result in an inconsistency with the SCAQMD AQMP. Therefore, a less than significant impact will occur.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Mitigation Measure 1

The project applicant shall require that all off-road diesel-powered construction equipment greater than 50 horsepower shall meet the Tier 4 Final emissions standards and shall be registered with CARB and labelled detailing that the equipment meets Tier 4 emissions standards.

Mitigation Measure 2

Prior to the start of haul truck operations, the project applicant shall pave, install the All Terrain Road™ Composite Mat System, or a similar product to the All Terrain Road™ that is no less effective than a paved road at controlling fugitive dust emissions on the top of the central levee spanning the spreading grounds in a northeast-southwest direction. The paving or Composite Mat System shall be of sufficient length to cover the greater of either: (1) a minimum of 25 percent of the total off-road path length being utilized by the haul trucks within the spreading grounds; or (2) a minimum of 660 linear feet (1/8 mile) of the paving or Composite Mat System. The paving or Composite Mat System shall be routinely inspected and maintained, as often as needed to ensure the integrity of the surface and eliminate fugitive dust emissions from the off-road segments with this treatment. The haul truck drivers shall be directed to drive on the paving or Composite Mat System exclusively unless there is no feasible alternative.

Level of Significance After Mitigation

Less than significant impact.

7.3 Air Quality Standard Violation

The proposed project would not violate an air quality standard or contribute substantially to an existing or projected air quality violation. The following section calculates the potential air emissions associated with the construction and operations of the proposed project and compares the emissions to the SCAQMD standards.

Construction Emissions

The proposed project would consist of intake structure improvements, removal of sediment and reconfiguration of the spreading basins. The construction emissions have been analyzed for both regional and local air quality impacts as well as potential toxic air impacts and odor impacts.

Construction-Related Regional Impacts

The CalEEMod model has been utilized to calculate the construction-related regional emissions from the proposed project and the input parameters utilized in this analysis have been detailed in Section 5.1. The worst-case daily construction-related criteria pollutant emissions from the proposed project from the use of either 14-cubic yard haul trucks or 18-cubic yard haul trucks are shown below in Table J.

Table J shows that NOx emissions would exceed the SCAQMD's regional emissions thresholds for the worst-case condition, which consists of the use of 372 daily truck trips of the 18 cubic yard haul trucks. None of the other analyzed criteria pollutants would exceed the SCAQMD's regional emissions thresholds. This would be considered a significant impact.

Table J – Construction-Related Criteria Pollutant Emissions Prior to Mitigation

Activity	Pollutant Emissions[1] (pounds per day)					
	VOC	**NOx**	**CO**	**SO_2**	**PM10**	**PM2.5**
Onsite Equipment	4.90	49.67	27.01	0.06	7.29	4.85
Worker Trips	0.11	0.08	0.97	0.00	0.20	0.06
Demolition Haul Trucks	0.00	0.04	0.01	0.00	0.03	0.00
14 Cubic Yard Haul Trucks[2]	2.23	36.89	19.00	0.10	42.09	8.50
18 Cubic Yard Haul Trucks[3]	1.84	66.02	13.63	0.13	26.34	5.02
Worst-Case Total Emissions[4]	6.85	**115.81**	46.99	0.19	49.61	13.41
SCAQMD Thresholds	**75**	**100**	**550**	**150**	**150**	**55**
Exceeds Threshold?	No	**Yes**	No	No	No	No

Notes:
[1] Emissions based on adherence to fugitive dust suppression requirements from SCAQMD Rule 403.
[2] Based on 478 Medium-Heavy Duty (T6) truck trips per day.
[3] Based on 372 Heavy-Heavy Duty (T7) truck trips per day.
[4] Based on highest of either the 14-cubic yard haul trucks or 18-cubic yard haul trucks for each pollutant.

Mitigation Measure 1 is provided that would require all off-road equipment greater than 50 horsepower that are operated on the Pacoima Spreading Grounds area to meet Tier 4 Final emissions standards. The project-related criteria pollutant emissions have been recalculated with implementation of Mitigation Measure 1 through use of the CalEEMod model and the results are shown in Table K. Table K shows that with implementation of Mitigation Measure 1, the proposed project's regional NOx emissions would be reduced to less than significant levels.

Table K – Mitigated Construction-Related Criteria Pollutant Emissions

Activity	Pollutant Emissions[1] (pounds per day)					
	VOC	**NOx**	**CO**	**SO_2**	**PM10**	**PM2.5**
Onsite Equipment[2]	0.68	3.52	29.68	0.06	4.96	2.69
Worker Trips	0.11	0.08	0.97	0.00	0.20	0.06
Demolition Haul Trucks	0.00	0.04	0.01	0.00	0.19	0.02

Construction-Related Local Impacts

Construction-related air emissions may have the potential to exceed the State and Federal air quality standards in the project vicinity, even though these pollutant emissions may not be significant enough to create a regional impact to the South Coast Air Basin. The proposed project has been analyzed for the potential local criteria pollutant impacts created from construction-related fugitive dust and construction equipment and from toxic air contaminants created from diesel emissions**.**

Local Criteria Pollutant Impacts from Construction

The local criteria pollutant emissions from construction were analyzed through utilizing the methodology described in *Localized Significance Threshold Methodology* (LST Methodology), prepared by SCAQMD, revised October 2009. The LST Methodology found the primary criteria pollutant emissions of concern are NOx, CO, PM10, and PM2.5. In order to determine if any of these pollutants require a detailed analysis of the local air quality impacts, each phase of construction was screened using the SCAQMD's Mass Rate LST Look-up Tables. The Look-up Tables were developed by the SCAQMD in order to readily determine if the daily onsite emissions of CO, NOx, PM10, and PM2.5 from the proposed project could result in a significant impact to the local air quality.

The emission thresholds were calculated based on the East San Fernando Valley source receptor area and a disturbance of five acres which is the largest acreage available in the Look-Up Tables. As detailed above in Section 1.4, the nearest offsite sensitive receptors to the proposed project area located as near as 30 feet from the proposed improvements to the spreading grounds. According to the LST Methodology, any receptor located closer than 25 meters (82 feet) shall be based on the 25-meter thresholds. Table L shows the onsite emissions from the CalEEMod model from the use of either 14-cubic yard haul trucks or 18-cubic yard haul trucks and the calculated emissions thresholds.

Table L – Screening of the Local Construction Emissions at the Nearest Receptors

Activity	Pollutant Emissions (pounds/day)			
	NOx	**CO**	**PM10**	**PM2.5**
Onsite Construction Equipment	49.67	27.01	7.29	4.85
Onsite 14 Cubic Yard Haul Trucks	0.67	0.34	0.76	0.15
Onsite Dirt Roads With 14 Cubic Yard Haul Trucks[1]	0.00	0.00	17.02	1.62
Onsite 18 Cubic Yard Haul Trucks	1.20	0.25	0.48	0.09
Onsite Dirt Roads With 18 Cubic Yard Haul Trucks[1]	0.00	0.00	10.86	1.03
Worst-Case Total Emissions	**50.87**	**27.26**	**25.07**	**5.97**
SCAQMD Thresholds for 25 meters (82 feet) or less[2]	172	1,434	14	8
Exceeds Screening Threshold?	No	No	**Yes**	No

Notes:
[1] The onsite dirt road emissions were calculated by running the CalEEMod twice, once with 100% paved roads and then with 98.4% paved roads and then taking the difference to obtain the onsite emissions.
[2] The nearest sensitive receptors are detailed above in Section 1.4 and are as close as 30 feet to the proposed improvements. According to LST methodology any receptor closer than 25 meters should be based on the 25-meter threshold.
Source: CalEEMod and SCAQMD's Mass Rate Look-up Tables for five acres in East San Fernando Valley.

The screening data provided in Table L shows that NOx, CO, and PM2.5 emissions would not exceed the local emissions thresholds. Table L also shows that the fugitive dust PM10 emissions may exceed the local emissions thresholds during construction activities. It should be noted that an exceedance of screening threshold only means that additional localized dispersion analysis is necessary and does not represent an occurrence of a localized significant impact.

The PM10 24-hour average concentration levels at the nearby sensitive receptors were calculated with AERMOD view and the same parameters detailed above in Section 5.2 for the TAC emissions analysis except that the emission source was changed to an area source that covered a majority of the project site (154 acres or 623,862 square meters). The area source for PM10 emissions was based on an emission rate of 6.329E-07 grams per second that was calculated by converting the onsite 25.07 pounds of PM10 per day to grams per second over an 8-hour period and then dividing by 623,862 square meters. Table M provides a summary of the calculated PM10 onsite construction emission concentrations at the nearest sensitive receptors. The onsite fugitive dust PM10 emissions calculations printouts are provided in Appendix E.

The data provided in Table M shows that the local PM10 concentrations at Sensitive Receptors 2, 3, 4, 5, 8, and 9 would exceed the SCAQMD's local threshold of significance of 10.4 µg/m^3 for PM10 concentrations during construction activities. This would be considered a significant impact.

Mitigation Measure 1 is provided that would require all off-road equipment greater than 50 horsepower that are operated on the Pacoima Spreading Grounds area to meet Tier 4 Final emissions standards. In addition, Mitigation Measure 2 is provided that would require the project applicant to pave or install the All Terrain Road™ Composite Mat System or a similar product that is no less effective than a paved road at controlling fugitive dust emissions on the top of the central levee spanning the spreading grounds in a northeast-southwest direction. The chosen surface treatment shall be installed on the greater of: (1) a minimum of 25 percent of off-road haul truck paths on the project site or (2) a minimum of 660 linear feet prior to the start of hauling activities. The surface treatment shall be inspected and maintained as often as needed to ensure the integrity of the surface. The purpose of Mitigation Measure 2 is to reduce the haul truck off-road (i.e., dirt road) travel by 25 percent. As detailed above in Table J and Table K, Mitigation Measure 1 would reduce onsite equipment PM10 emissions by 2.33 pounds per day and Mitigation Measure 2 would reduce dirt road haul trucks emission by 4.26 pounds to a total onsite PM10 emission rate of 18.49 pounds per day. The mitigated area source for PM10 emissions was based on an emission rate of 4.668E-07 grams per second that was calculated by converting the onsite 20.55 pounds of PM10 per day to grams per second over an 8-hour period and then dividing by 623,862 square meters.

Table M also provides a summary of the calculated mitigated PM10 onsite construction emission concentrations at the nearest sensitive receptors. The mitigated onsite fugitive dust PM10 emissions calculations printouts are provided in Appendix F. Table M shows that with implementation of Mitigation Measures 1 and 2, the local PM10 concentrations would be within the SCAQMD's local threshold of significance of 10.4 µg/m^3 for PM10 concentrations during construction activities. Therefore, with implementation of Mitigation Measures 1 and 2, a less than significant local air quality impact would occur from construction of the proposed project.

Table M – Local PM10 Concentrations at Nearby Receptors

Sensitive Receptor	Receptor Description	Receptor Location[1] X	Receptor Location[1] Y	24-hour PM10 Concentrations (µg/m^3) Unmitigated	24-hour PM10 Concentrations (µg/m^3) Mitigated

Construction-Related Toxic Air Contaminant Impacts

The proposed project would consist of intake structure improvements, removal of sediment and reconfiguration of the spreading basins. The proposed improvements would require the use of diesel powered off-road equipment as well as diesel powered haul trucks that would result in the emissions of diesel particulate matter (DPM), which is a TAC. The proposed project's construction-related impacts from DPM to the nearby sensitive receptors has been analyzed through use of the AERMOD model and the model input parameters that have been detailed above in Section 5.2.

Health risks from TACs are twofold. First, TACs are carcinogens according to the State of California. Second, short-term acute and long-term chronic exposure to TACs can cause health effects to the respiratory system and other organs. Each of these health risks is discussed below.

Cancer Risks

It is often estimated that the incidence in cancer over a lifetime for the U.S. population will affect 25 percent of all persons, or a risk of about 250,000 per million persons. The MATES-III study referenced a Harvard Report on Cancer Prevention, which estimated that of cancers associated with known risk factors, about 30 percent were related to tobacco, about 30 percent were related to diet and obesity, and about 2 percent were associated with environmental pollution related exposures that includes hazardous air pollutants.

According to SCAQMD methodology, health effects from carcinogenic air toxics are usually described in terms of individual cancer risk. "Individual Cancer Risk" is the likelihood that a person exposed to concentrations of toxic air contaminants over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology. According to the *Air Toxics Hot Spots Program Risk Assessment Guidelines*, prepared by OEHHA, February 2015, the cancer risk should be calculated using the following formula. (It should be noted that the OEHHA formula only provides for residential and off-site worker receptors, since it is possible for people to work at the school, hospital and park, these land uses have also utilized the off-site worker rates).

[Dose-inh (mg/(Kg-day)] * [Oral Slope Factor (kg-day)/mg]*[$1x10^6$] * Age Sensitivity Factor * Fraction of Time at Home = Potential Cancer Risk

Where:
Oral Slope Factor = 1.1
Age Sensitivity Factor = 10 for 3rd trimester to 2 years
Fraction of Time at Home = 0.85 for 3rd trimester to 2 years.
Dose-inh = (C_{air} * DBR * A * EF * ED * 10^6) / AT

Where:

C_{air}	[Concentration in air ($\mu g/m^3$)] = (Calculated by AERMOD Model)
DBR	[Daily breathing rate (L/kg body weight – day)] = 867 for 3rd trimester to 2 years for residential and uniform rate of 100 for offsite workers.
A	[Inhalation absorption factor] = 1
EF	[Exposure frequency (days/year)] = 260 workdays per year
ED	[Exposure duration (years)] = 21 months or 1.75 years (worst-case duration length)
10^6	[Micrograms to milligrams conversion]
AT	[Average time period over which exposure is averaged in days] = 25,550

According to the OEHHA formula the residential receptors equates to C_{air} * 145 = Potential Cancer Risk and the offsite worker, school, hospital, and park area receptors equates to C_{air} * 2 = Potential Cancer Risk. The model run PM10 results are shown below in Figure 4 on page 50 for the unmitigated conditions and Appendix G. Table N provides a summary of the calculated diesel PM10 emission concentrations at the nearest sensitive receptors.

Table N – Diesel PM10 Levels and Cancer Risks Prior to Mitigation

Sensitive Receptor	Receptor Description	Receptor Location[1] X	Receptor Location[1] Y	Annual PM10 Concentration (µg/m³)	Cancer Risk Per Million People[1]
1	SFR – NW of Intake Structure	367,030	3,792,240	0.1707	**24.7**
2	SFR – N of Spreading Grounds	366,644	3,792,082	0.1114	**16.1**
3	SFR – NW of Spreading Grounds	366,494	3,791,913	0.0733	**10.6**
4	SFR – W of Spreading Grounds	366,294	3,791,729	0.0803	**11.6**
5	Park – W of Spreading Grounds	366,214	3,791,536	0.0997	0.2
6	SFR – SW of Spreading Grounds	366,272	3,791,136	0.0532	7.7
7	SFR – SE of Spreading Grounds	366,526	3,790,962	0.0858	**12.4**
8	SFR – E of Spreading Grounds	367,107	3,791,450	0.0952	**13.8**
9	SFR – E of Spreading Grounds	367,095	3,791,634	0.0904	**13.1**
10	SFR – SE of Paxton Street	367,081	3,791,995	0.0627	9.1
11	MFR – SE of Paxton Street	367,267	3,792,154	0.0412	6.0
12	SFR – S of Devonshire Street	366,025	3,791,611	0.1707	**24.7**
				Threshold of Significance	**10**
				Exceeds Threshold?	**Yes**

Notes:
[1] Receptor location based on World Geodetic System 1984 (WGS84), Universal Transverse Mercator (UTM).
[2] Cancer risk based on a residential receptor cancer risk = 145 x Cair; off-site worker, school, church and park cancer risk = 2 x Cair.
Source: Calculated from ISC-AERMOD View Version 9.4.0.

Table N shows that the cancer risk from construction-related DPM emissions would be as high as 24.7 per million persons (Sensitive Receptor 1) at the nearby sensitive receptors. The construction-related DPM emissions in the vicinity of the Spreading Grounds would exceed the SCAQMD's cancer risk threshold of 10 per million persons. This would be considered a significant impact.

Mitigation Measure 1 is provided that would require all off-road equipment greater than 50 horsepower that are operated on the Pacoima Spreading Grounds area to meet Tier 4 Final emissions standards. The project-related DPM emissions have been recalculated with the AERMOD model with implementation of Mitigation Measure 1 and the results are shown in Table O and in Figure 5 on page 51. The AERMOD printouts for the mitigated condition are provided in Appendix H. Table O shows that with implementation of Mitigation Measure 1, the construction-related cancer risks from the proposed project's DPM emissions would be reduced to less than significant levels.

[2] Cancer risk based on a residential receptor cancer risk = 145 x Cair; off-site worker, school, church and park cancer risk = 2 x Cair.
Source: Calculated from ISC-AERMOD View Version 9.4.0.

Non-Cancer Risks

In addition to the cancer risk from exposure to DPM there is also the potential DPM exposure may result in adverse health impacts from acute and chronic illnesses, which are detailed below.

Chronic Health Impacts

Chronic health effects are characterized by prolonged or repeated exposure to a TAC over many days, months, or years. Symptoms from chronic health impacts may not be immediately apparent and are often irreversible. The chronic hazard index is based on the most impacted sensitive receptor from the proposed project and is calculated from the annual average concentrations of PM10. The relationship for non-cancer chronic health effects is given by the equation:

$$HI_{DPM} = C_{DPM} / REL_{DPM}$$

Where,

HI_{DPM} = Hazard Index; an expression of the potential for non-cancer health effects.

C_{DPM} = Annual average diesel particulate matter concentration in µg/m^3.

REL_{DPM}= Reference Exposure Level (REL) for diesel particulate matter; the diesel particulate matter concentration at which no adverse health effects are anticipated.

The REL_{DPM} is 5 µg/m^3. The Office of Environmental Health Hazard Assessment as protective for the respiratory system has established this concentration. As detailed above in , the AERMOD model found that the highest annual concentration at the nearest sensitive receptor is 0.1707 µg/m^3 for DPM equivalent chronic non-cancer risk emissions. The resulting Hazard Index is:

$$HI_{DPM} = 0.1707 / 5 = 0.0341$$

The criterion for significance is a Chronic Hazard Index increase of 1.0 or greater, which is detailed above in Section 3.0. Therefore, the on-going operations of the proposed project would result in a less than significant impact due to the non-cancer chronic health risk from TAC emissions created by the proposed project.

Acute Health Impacts

Acute health effects are characterized by sudden and severe exposure and rapid absorption of a TAC. Normally, a single large exposure is involved. Acute health effects are often treatable and reversible. The acute hazard index is calculated from the maximum hourly concentrations of PM10 and TOG at the point of maximum impact (PMI), which has been calculated with the AERMOD model and the parameters detailed above in Section 4.0. The relationship for non-cancer acute health effects is given by the equation:

$$AHI = C / AREL$$

Where,

AHI = Acute Hazard Index; an expression of the potential for non-cancer health effects.
C = Maximum hourly concentration of either PM10 or TOG in $\mu g/m^3$.
AREL = Acute Reference Exposure Level.

The AERMOD model found that the proposed project would create maximum hourly concentrations of 1.99 $\mu g/m^3$ of PM10 and 4.51 $\mu g/m^3$ of TOG at the PMI . Appendix G provides the AERMOD output files for the PM10 calculations and Appendix I provides the AERMOD output files for the TOG calculations. Table P provides a list of TAC pollutants from diesel emissions that have the potential to cause acute health risks, the associated pollutant analyzed in the AERMOD model, the ratio of the pollutant to total diesel emissions, the AREL for each pollutant and the calculated Acute Hazard Index for each pollutant.

Table P – Acute Non-Cancer Assessment

TAC from Diesel Emissions	Pollutant	Diesel Weight Ratio[1]	Acute Reference Exposure Level (AREL)[2] $\mu g/m^3$	Acute Hazard Index (AHI)
Acetaldehyde	TOG	0.0735	470	6.75E-04
Acrolein	TOG	0.003	25	5.18E-04
Arsenic	PM	0.000002	0.2	1.99E-05
Benzene	TOG	0.02	1,300	6.64E-05
Chlorine	PM	0.00003	210	2.85E-07
Copper	PM	0.00006	100	1.20E-06
Formaldehyde	TOG	0.1471	55	1.15E-02
Mercury	PM	0.000006	0.6	1.99E-05
Methanol	TOG	0.0408	28,000	6.29E-06
Methyl Ethyl Ketone	TOG	0.0148	13,000	4.91E-06
Nickel	PM	0.000008	6	2.66E-06
Styrene	TOG	0.0006	21,000	1.23E-07
Toluene	TOG	0.0147	37,000	1.71E-06
Vanadium	PM	0.001	30	6.64E-05
Xylene	TOG	0.0104	22,000	2.04E-06
			Total	**1.29E-02 (0.0129)**
			Threshold	**1.00E-00 (1.0)**
			Exceeds Threshold?	**No**

Notes:
[1] Diesel related TAC composition is based on the ARB speciation profile 6099 for PM and 818 for VOC.

[2] Acute REL is from http://oehha.ca.gov/air/allrels.html.

Table P shows that the total acute hazard index from the proposed project would be 0.0129. The criterion for significance is an Acute Hazard Index increase of 1.0 or greater, which is detailed above in Section 3.0. Therefore, the construction activities for the proposed project would result in a less than significant impact due to the non-cancer acute health risk from TAC emissions created by the proposed project.

Operational Emissions

The on-going operation of the proposed project would not result in a long-term increase in air quality emissions. Currently, the project site requires occasional periodic visits from LACFCD staff and result in air emissions from the vehicle transporting the workers to and from the project site. Implementation of the proposed project would not result in any additional site visits from LACFCD staff. Therefore, implementation of the proposed project would not increase either criteria pollutant or TAC emissions from the proposed project and would result in a less than significant impact.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Mitigation Measures 1 and 2 provided above in Impact 7.2.

Level of Significance After Mitigation

Less than significant impact.

7.4 Cumulative Net Increase in Non-Attainment Pollution

The proposed project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors).

Cumulative projects include local development as well as general growth within the project area. However, as with most development, the greatest source of emissions is from mobile sources, which travel throughout the local area. Therefore, from an air quality standpoint, the cumulative analysis would extend beyond any local projects and when wind patterns are considered would cover an even larger area. Accordingly, the cumulative analysis for the project's air quality must be generic by nature. The project area is out of attainment for ozone and PM10 (State only) and PM2.5 particulate matter. In accordance with CEQA Guidelines Section 15130(b), this analysis of cumulative impacts incorporates a three-tiered approach to assess cumulative air quality impacts.

- Consistency with the SCAQMD project specific thresholds for construction and operations;
- Project consistency with existing air quality plans; and
- Assessment of the cumulative health effects of the pollutants.

Consistency with Project Specific Thresholds

Construction-Related Impacts

The project site is located in the South Coast Air Basin, which is currently designated as a non-attainment area for ozone, PM10, and PM2.5. The ozone, PM10, and PM2.5 emissions associated with the proposed project have been calculated above in Section 6.3. The above analysis found that with implementation of

Mitigation Measures 1 and 2, development of the proposed project would result in less than significant regional and local emissions of the precursors to ozone, PM10 and PM2.5 during construction of the proposed project. Therefore, a less than significant cumulative impact would occur from construction of the proposed project.

Operational-Related Impacts

As detailed in Section 7.3, the project site currently requires occasional periodic visits from LACFCD staff and result in air emissions from the vehicle transporting the workers to and from the project site. Implementation of the proposed project would not result in any additional site visits from LACFCD staff. Therefore, a less than significant cumulative impact would occur from operation of the proposed project.

Consistency with Air Quality Plans

As detailed in Section 7.2, the project site is currently designated as Open Space in the General Plan and is also zoned Open Space (OS-1XL-O). The proposed project would not change the current use as a spreading ground and is consistent with the current land use designation and zoning. Therefore, the proposed project would not result in an inconsistency with the current land use designation. Therefore, the proposed project is not anticipated to exceed the AQMP assumptions for the project site and is found to be consistent with the AQMPs for the South Coast Air Basin.

Cumulative Health Impacts

The South Coast Air Basin is designated as nonattainment for ozone, PM10, and PM2.5, which means that the background levels of those pollutants are at times higher than the ambient air quality standards. The air quality standards were set to protect public health, including the health of sensitive individuals (elderly, children, and the sick). Therefore, when the concentrations of those pollutants exceeds the standard, it is likely that some sensitive individuals in the population would experience health effects. The regional analysis detailed in Section 7.3 found that the proposed project would not exceed the SCAQMD regional significance thresholds for VOC and NOx (ozone precursors), PM10 and PM2.5. Therefore, the proposed project would result in a less than significant cumulative health impact.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Mitigation Measures 1 and 2 provided above in Impact 7.2.

Level of Significance After Mitigation

Less than significant impact.

7.5 Sensitive Receptors

The proposed project would not expose sensitive receptors to substantial pollutant concentrations. The local concentrations of emissions produced in the nearby vicinity of the proposed project, which may expose sensitive receptors to substantial concentrations have been calculated in Section 6.3 for both construction and operations, which are discussed separately below.

Construction-Related Sensitive Receptor Impacts

The nearest off-site sensitive receptors to the spreading basins consist of multi-family homes as near as 35 feet southwest of the proposed improvements to the spreading grounds, single-family homes as near as 40 feet north and west of the proposed improvements to the spreading grounds, and Devonwood Park located

as near as 30 feet west of the proposed improvements to the spreading grounds. There are also single-family homes as near as 50 feet north of the intake canal improvements and single-family and multi-family homes as near as 25 feet from where haul trucks would operate on the nearby roads.

The analysis in Section 7.3 found that construction of the proposed project would exceed the local PM10 thresholds of significance discussed in Section 6.2. Implementation of Mitigation Measures 1 and 2 would reduce this impact to less than significant levels. Therefore, with implementation of Mitigation Measures 1 and 2 construction of the proposed project would result in a less than significant exposure of sensitive receptors to substantial pollutant concentrations.

Operations-Related Sensitive Receptor Impacts

The on-going operations of the proposed project would not expose sensitive receptors to substantial pollutant concentrations in the immediate vicinity of the proposed project from on-site operations. As detailed in Section 7.3, the project site currently requires occasional periodic visits from LACFCD staff and result in air emissions from the vehicle transporting the workers to and from the project site. Implementation of the proposed project would not result in any additional site visits from LACFCD staff. Therefore, operation of the proposed project would result in a less than significant exposure of sensitive receptors to substantial pollutant concentrations.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Mitigation Measures 1 and 2 provided above in Impact 7.2.

Level of Significance After Mitigation

Less than significant impact.

7.6 Objectionable Odors

The proposed project would not create objectionable odors affecting a substantial number of people. Potential odor impacts have been analyzed separately for construction and operations below.

Individual responses to odors are highly variable and can result in a variety of effects. Generally, the impact of an odor results from a variety of factors such as frequency, duration, offensiveness, location, and sensory perception. The frequency is a measure of how often an individual is exposed to an odor in the ambient environment. The intensity refers to an individual's or group's perception of the odor strength or concentration. The duration of an odor refers to the elapsed time over which an odor is experienced. The offensiveness of the odor is the subjective rating of the pleasantness or unpleasantness of an odor. The location accounts for the type of area in which a potentially affected person lives, works, or visits; the type of activity in which he or she is engaged; and the sensitivity of the impacted receptor.

Sensory perception has four major components: detectability, intensity, character, and hedonic tone. The detection (or threshold) of an odor is based on a panel of responses to the odor. There are two types of thresholds: the odor detection threshold and the recognition threshold. The detection threshold is the lowest concentration of an odor that will elicit a response in a percentage of the people that live and work in the immediate vicinity of the project site and is typically presented as the mean (or 50 percent of the population). The recognition threshold is the minimum concentration that is recognized as having a characteristic odor quality, this is typically represented by recognition by 50 percent of the population. The intensity refers to the perceived strength of the odor. The odor character is what the substance smells like.

The hedonic tone is a judgment of the pleasantness or unpleasantness of the odor. The hedonic tone varies in subjective experience, frequency, odor character, odor intensity, and duration.

The SCAQMD receives and investigates odor complaints from nearby residents and, if six or more odor events are reported in a year, the SCAQMD opens an investigation into the odor complaints. If the SCAQMD determines that the emission source from the project site indicated by the complainants is in violation of Rule 402, they have the authority to require the offender to implement measures to eliminate the odor impacts. If the proposed project results in a violation of Rule 402 with regards to odor impacts, then the proposed project would create a significant odor impact. However, as described below, based on the Project location and types of construction activity, significant odor impacts are not anticipated.

Construction-Related Odor Impacts

Potential sources that may emit odors during construction activities include the application of materials such as asphalt pavement, from emissions associated with the operation of diesel equipment, and possibly from disturbing decaying organic material during earthmoving activities. The diesel equipment utilized onsite would be constantly moving around the project site and any odors created from diesel equipment would be temporary at any one location and would not likely be noticeable for extended periods of time beyond the project site's boundaries. In addition, the application of materials such as asphalt pavement would be installed over a couple of days for any one location and would result in temporary odor impacts that would not likely be noticeable for extended periods of time beyond the project site's boundaries.

The potential odor impacts associated with excavation activities would be caused by release of material that contain even small amounts of sulfur or organic material. Sulfur compounds have very low odor threshold levels. For instance hydrogen sulfide can be detected by humans at concentrations from 0.5 parts per billion (ppb) that is noticeable by 2 percent of the population, to 40 ppb that is qualified as annoying by 50 percent of the population. It should be noted that the project site has been utilized as spreading grounds since the 1930's and vegetation has been removed from the spreading grounds on regular intervals for the entire duration of operations, so the amount of organic material in the soil should be minimal. Furthermore, soil in the project vicinity is not known to contain high levels of sulfur so odor impacts from sulfur in the soil is unlikely to occur. Therefore, a less than significant odor impact is anticipated to occur from construction activities associated with the proposed project.

Potential Operations-Related Odor Impacts

The proposed project would consist of intake structure improvements, removal of sediment and reconfiguration of the spreading basins. The proposed project would not introduce any new sources of odors to the project site, nor would it reconfigure any existing sources of odors on the project site. Impacts would be less than significant.

Level of Significance

Less than significant impact.

7.7 Generation of Greenhouse Gas Emissions

The proposed project would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. The proposed project would consist of intake structure improvements, removal of sediment and reconfiguration of the spreading basins. The proposed project is anticipated to generate GHG emissions only from construction activities.

The CalEEMod Version 2016.3.1 was used to calculate the GHG emissions from construction activities associated with the proposed project. The GHG emissions analysis utilized the same CalEEMod model

inputs as what was used for the criteria pollutant analysis and the CalEEMod input parameters are detailed in Section 5.1.

Project Greenhouse Gas Emissions

The project's GHG emissions have been calculated with CalEEMod model based on the parameters detailed above. A summary of the results from the use of either 14-cubic yard haul trucks or 18-cubic yard haul trucks are shown below in Table Q and CalEEMod model run for the 14-cubic yard haul trucks analysis is provided in Appendix J and for the 18-cubic yard haul trucks analysis is provided in Appendix K.

Table Q – Project Related Greenhouse Gas Annual Emissions

	Greenhouse Gas Emissions (Metric Tons per Year)			
Construction Activities	**CO_2**	**CH_4**	**N_2O**	**CO_2e**
Onsite Equipment Emissions	755.18	0.22	0	760.60
Worker Trips	28.95	0	0	28.98
Demolition Haul Trucks	1.05	0	0	1.05
14 Cubic Yard Haul Trucks[1]	1,249.07	0.03	0	1,249.71
18 Cubic Yard Haul Trucks[2]	1,610.53	0.15	0	1,614.24
Worst-Case Total GHG Emissions[3]	**2,395.71**	**0.37**	**0.00**	**2,404.87**
	SCAQMD Draft Threshold of Significance			**3,000**
			Exceed Threshold?	**No**

Notes:
[1] Based on 480 Medium-Heavy Duty (T6) truck trips per day.
[2] Based on 360 Heavy-Heavy Duty (T7) truck trips per day.
[3] Based on highest of either the 14-cubic yard haul trucks or 18-cubic yard haul trucks for each pollutant.
Source: CalEEMod Version 2016.3.1.

The data provided in Table Q above shows that the proposed project would create 2,404.87 $MTCO_2e$. According to the SCAQMD draft threshold of significance detailed in Section 5.5, a cumulative global climate change impact would occur if the GHG emissions created from a proposed project would exceed 3,000 $MTCO_2e$ per year. Therefore, a less than significant generation of greenhouse gas emissions would occur from development of the proposed project.

Level of Significance

Less than significant impact.

7.8 Greenhouse Gas Plan Consistency

The proposed project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing GHG emissions. The City of Los Angeles has adopted the *Green LA Climate Change Action Plan* (Climate Action Plan). The Climate Action Plan details Action W3, which requires the City to implement an innovative water and wastewater integrated resources plan that will maximize use of recycled water including capture and reuse of stormwater. The proposed project would increase the water holding capacity of the spreading grounds from 530 acre-feet to 1,197 acre-feet by combining and deepening the existing 12 spreading basins. The proposed project would also increase the percolation rate of the spreading basins from 65 cubic feet per second to 142 cubic feet per second, which will also allow for the capture of more stormwater. Based on the above, the proposed project promotes the implementation of the Actions in the Climate Action Plan. Therefore, the proposed project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

Level of Significance

Less than significant impact.

1.3 User Entered Comments & Non-Default Data

Pacoima Spreading Ground Improvement Project with 14 CY Trucks - Los Angeles-South Coast County, Summer

Project Characteristics - 2018

Land Use - 169 acres of User Defined Industrial

Construction Phase - Construction was modelled as occurring from 11-1-18 to 6-1-20

Off-road Equipment -

Off-road Equipment - 2 Excavators (8 hrs each), 2 rubber tired dozers (8 hrs each), 1 sediment shaker (Crushing/Proc Equip) (8 hrs), 3 water trucks (Off-Hwy Trucks) (4 hrs each), 1 street sweeper (4 hrs)

Trips and VMT - 18 worker trips per TIA. 77 haul trips of concrete debris to Sunshine Cyn Landfill 8 miles length

On-road Fugitive Dust - Haul Trip Length 8 miles of which 1/8 mile on dirt roads or 98.4% of haul trip length on paved roads. Per SCAQMD Rule 403 Road Moisture 12%

Grading - 614 cubic yards of concrete exported and 169 acres graded

Vehicle Trips - 478 14 CY haul truck trips or 2.83 trips per acre. 100% Primary Trips. Non Res C-C 100% and 6.9 miles.

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Road Dust - 1/8 mile of 6.9 mile Haul Truck trips on dirt road or 98.2% of trips on paved roads avg weight 20 tons. Per SCAQMD Rule 403 Unpaved Road Moisture Content 12%.Mean speed 15 mph.

Energy Use -

Construction Off-road Equipment Mitigation - Water Exposed Areas 3 times per day and maintain Unpaved Roads at 12% moisture, per SCAQMD Rule 403 requirements

Fleet Mix - Fleet Mix - 100% MHD

1.3 User Entered Comments & Non-Default Data

Pacoima Spreading Ground Improvement Project with 14 CY Trucks - Los Angeles-South Coast County, Winter

Project Characteristics - 2018

Land Use - 169 acres of User Defined Industrial

Construction Phase - Construction was modelled as occurring from 11-1-18 to 6-1-20

Off-road Equipment -

Off-road Equipment - 2 Excavators (8 hrs each), 2 rubber tired dozers (8 hrs each), 1 sediment shaker (Crushing/Proc Equip) (8 hrs), 3 water trucks (Off-Hwy Trucks) (4 hrs each), 1 street sweeper (4 hrs)

Trips and VMT - 18 worker trips per TIA. 77 haul trips of concrete debris to Sunshine Cyn Landfill 8 miles length

On-road Fugitive Dust - Haul Trip Length 8 miles of which 1/8 mile on dirt roads or 98.4% of haul trip length on paved roads. Per SCAQMD Rule 403 Road Moisture 12%

Grading - 614 cubic yards of concrete exported and 169 acres graded

Vehicle Trips - 478 14 CY haul truck trips or 2.83 trips per acre. 100% Primary Trips. Non Res C-C 100% and 6.9 miles.

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Road Dust - 1/8 mile of 6.9 mile Haul Truck trips on dirt road or 98.2% of trips on paved roads avg weight 20 tons. Per SCAQMD Rule 403 Unpaved Road Moisture Content 12%.Mean speed 15 mph.

Energy Use -

Construction Off-road Equipment Mitigation - Water Exposed Areas 3 times per day and maintain Unpaved Roads at 12% moisture, per SCAQMD Rule 403 requirements

Fleet Mix - Fleet Mix - 100% MHD

1.3 User Entered Comments & Non-Default Data

Pacoima Spreading Ground Improvement Project with 18 CY Trucks - Los Angeles-South Coast County, Summer

Project Characteristics - 2018

Land Use - 169 acres of User Defined Industrial

Construction Phase - Construction was modelled as occurring from 11-1-18 to 6-1-20

Off-road Equipment -

Off-road Equipment - 2 Excavators (8 hrs each), 2 rubber tired dozers (8 hrs each), 1 sediment shaker (Crushing/Proc Equip) (8 hrs), 3 water trucks (Off-Hwy Trucks) (4 hrs each), 1 street sweeper (4 hrs)

Trips and VMT - 18 worker trips per TIA. 77 haul trips of concrete debris to Sunshine Cyn Landfill 8 miles length

On-road Fugitive Dust - Haul Trip Length 8 miles of which 1/8 mile on dirt roads or 98.4% of haul trip length on paved roads. Per SCAQMD Rule 403 Road Moisture 12%

Grading - 614 cubic yards of concrete exported and 169 acres graded

Vehicle Trips - 372 18 CY haul truck trips or 2.20 trips per acre. 100% Primary Trips. Non Res C-C 100% and 6.9 miles.

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Road Dust - 1/8 mile of 6.9 mile Haul Truck trips on dirt road or 98.2% of trips on paved roads avg weight 20 tons. Per SCAQMD Rule 403 Unpaved Road Moisture Content 12%. Mean speed 15 mph.

Energy Use -

Construction Off-road Equipment Mitigation - Water Exposed Areas 3 times per day and maintain Unpaved Roads at 12% moisture, per SCAQMD Rule 403 requirements

Fleet Mix - Fleet Mix - 100% HHD

1.3 User Entered Comments & Non-Default Data

Pacoima Spreading Ground Improvement Project with 18 CY Trucks - Los Angeles-South Coast County, Winter

Project Characteristics - 2018

Land Use - 169 acres of User Defined Industrial

Construction Phase - Construction was modelled as occurring from 11-1-18 to 6-1-20

Off-road Equipment -

Off-road Equipment - 2 Excavators (8 hrs each), 2 rubber tired dozers (8 hrs each), 1 sediment shaker (Crushing/Proc Equip) (8 hrs), 3 water trucks (Off-Hwy Trucks) (4 hrs each), 1 street sweeper (4 hrs)

Trips and VMT - 18 worker trips per TIA. 77 haul trips of concrete debris to Sunshine Cyn Landfill 8 miles length

On-road Fugitive Dust - Haul Trip Length 8 miles of which 1/8 mile on dirt roads or 98.4% of haul trip length on paved roads. Per SCAQMD Rule 403 Road Moisture 12%

Grading - 614 cubic yards of concrete exported and 169 acres graded

Vehicle Trips - 372 18 CY haul truck trips or 2.20 trips per acre. 100% Primary Trips. Non Res C-C 100% and 6.9 miles.

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Road Dust - 1/8 mile of 6.9 mile Haul Truck trips on dirt road or 98.2% of trips on paved roads avg weight 20 tons. Per SCAQMD Rule 403 Unpaved Road Moisture Content 12%. Mean speed 15 mph.

Energy Use -

Construction Off-road Equipment Mitigation - Water Exposed Areas 3 times per day and maintain Unpaved Roads at 12% moisture, per SCAQMD Rule 403 requirements

Fleet Mix - Fleet Mix - 100% HHD

Project Characteristics - 2018

Land Use - 169 acres of User Defined Industrial

Construction Phase - Construction was modelled as occurring from 11-1-18 to 6-1-20

Off-road Equipment -

Off-road Equipment - 2 Excavators (8 hrs each), 2 rubber tired dozers (8 hrs each), 1 sediment shaker (Crushing/Proc Equip) (8 hrs), 3 water trucks (Off-Hwy Trucks) (4 hrs each), 1 street sweeper (4 hrs)

Trips and VMT - 18 worker trips per TIA. 77 haul trips of concrete debris to Sunshine Cyn Landfill 8 miles length

On-road Fugitive Dust - Haul Trip Length 8 miles of which 1/8 mile on dirt roads or 98.4% of haul trip length on paved roads. Per SCAQMD Rule 403 Road Moisture 12%

Grading - 614 cubic yards of concrete exported and 169 acres graded

Vehicle Trips - 372 18 CY haul truck trips or 2.20 trips per acre. 100% Primary Trips. Non Res C-C 100% and 6.9 miles.

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Road Dust - 1/8 mile of 6.9 mile Haul Truck trips on dirt road or 98.2% of trips on paved roads avg weight 20 tons. Per SCAQMD Rule 403 Unpaved Road Moisture Content 12%. Mean speed 15 mph.

Energy Use -

Construction Off-road Equipment Mitigation - Water Exposed Areas 3 times per day and maintain Unpaved Roads at 12% moisture, per SCAQMD Rule 403 requirements. All Equipmen >50 Hp Tier 4 Final

Fleet Mix - Fleet Mix - 100% HHD

1.3 User Entered Comments & Non-Default Data

Pacoima Spreading Ground Improvement Project with 18 CY Trucks - Los Angeles-South Coast County, Winter

Project Characteristics - 2018

Land Use - 169 acres of User Defined Industrial

Construction Phase - Construction was modelled as occurring from 11-1-18 to 6-1-20

Off-road Equipment -

Off-road Equipment - 2 Excavators (8 hrs each), 2 rubber tired dozers (8 hrs each), 1 sediment shaker (Crushing/Proc Equip) (8 hrs), 3 water trucks (Off-Hwy Trucks) (4 hrs each), 1 street sweeper (4 hrs)

Trips and VMT - 18 worker trips per TIA. 77 haul trips of concrete debris to Sunshine Cyn Landfill 8 miles length

On-road Fugitive Dust - Haul Trip Length 8 miles of which 1/8 mile on dirt roads or 98.4% of haul trip length on paved roads. Per SCAQMD Rule 403 Road Moisture 12%

Grading - 614 cubic yards of concrete exported and 169 acres graded

Vehicle Trips - 372 18 CY haul truck trips or 2.20 trips per acre. 100% Primary Trips. Non Res C-C 100% and 6.9 miles.

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Road Dust - 1/8 mile of 6.9 mile Haul Truck trips on dirt road or 98.2% of trips on paved roads avg weight 20 tons. Per SCAQMD Rule 403 Unpaved Road Moisture Content 12%. Mean speed 15 mph.

Energy Use -

Construction Off-road Equipment Mitigation - Water Exposed Areas 3 times per day and maintain Unpaved Roads at 12% moisture, per SCAQMD Rule 403 requirements. All Equipmen >50 Hp Tier 4 Final

Fleet Mix - Fleet Mix - 100% HHD

1.3 User Entered Comments & Non-Default Data

Pacoima Spreading Ground Improvement Project with 14 CY Trucks - Los Angeles-South Coast County, Annual

Project Characteristics - 2018

Land Use - 169 acres of User Defined Industrial

Construction Phase - Construction was modelled as occurring from 11-1-18 to 6-1-20

Off-road Equipment -

Off-road Equipment - 2 Excavators (8 hrs each), 2 rubber tired dozers (8 hrs each), 1 sediment shaker (Crushing/Proc Equip) (8 hrs), 3 water trucks (Off-Hwy Trucks) (4 hrs each), 1 street sweeper (4 hrs)

Trips and VMT - 18 worker trips per TIA. 77 haul trips of concrete debris to Sunshine Cyn Landfill 8 miles length

On-road Fugitive Dust - Haul Trip Length 8 miles of which 1/8 mile on dirt roads or 98.4% of haul trip length on paved roads. Per SCAQMD Rule 403 Road Moisture 12%

Grading - 614 cubic yards of concrete exported and 169 acres graded

Vehicle Trips - 478 14 CY haul truck trips or 2.83 trips per acre. 100% Primary Trips. Non Res C-C 100% and 6.9 miles.

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Road Dust - 1/8 mile of 6.9 mile Haul Truck trips on dirt road or 98.2% of trips on paved roads avg weight 20 tons. Per SCAQMD Rule 403 Unpaved Road Moisture Content 12%.Mean speed 15 mph.

Energy Use -

Construction Off-road Equipment Mitigation - Water Exposed Areas 3 times per day and maintain Unpaved Roads at 12% moisture, per SCAQMD Rule 403 requirements

Fleet Mix - Fleet Mix - 100% MHD

1.3 User Entered Comments & Non-Default Data

Pacoima Spreading Ground Improvement Project with 18 CY Trucks - Los Angeles-South Coast County, Annual

Project Characteristics - 2018

Land Use - 169 acres of User Defined Industrial

Construction Phase - Construction was modelled as occurring from 11-1-18 to 6-1-20

Off-road Equipment -

Off-road Equipment - 2 Excavators (8 hrs each), 2 rubber tired dozers (8 hrs each), 1 sediment shaker (Crushing/Proc Equip) (8 hrs), 3 water trucks (Off-Hwy Trucks) (4 hrs each), 1 street sweeper (4 hrs)

Trips and VMT - 18 worker trips per TIA. 77 haul trips of concrete debris to Sunshine Cyn Landfill 8 miles length

On-road Fugitive Dust - Haul Trip Length 8 miles of which 1/8 mile on dirt roads or 98.4% of haul trip length on paved roads. Per SCAQMD Rule 403 Road Moisture 12%

Grading - 614 cubic yards of concrete exported and 169 acres graded

Vehicle Trips - 372 18 CY haul truck trips or 2.20 trips per acre. 100% Primary Trips. Non Res C-C 100% and 6.9 miles.

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Road Dust - 1/8 mile of 6.9 mile Haul Truck trips on dirt road or 98.2% of trips on paved roads avg weight 20 tons. Per SCAQMD Rule 403 Unpaved Road Moisture Content 12%. Mean speed 15 mph.

Energy Use -

Construction Off-road Equipment Mitigation - Water Exposed Areas 3 times per day and maintain Unpaved Roads at 12% moisture, per SCAQMD Rule 403 requirements

Fleet Mix - Fleet Mix - 100% HHD

SECTION 1.0 – INTRODUCTION

This Biological Technical Report has been prepared for the Los Angeles County Department of Public Works (LACDPW) to support California Environmental Quality Act (CEQA) documentation for the proposed actions relating to the Pacoima Spreading Grounds Improvement Project (Project). Information contained in this document has been reported in accordance with accepted scientific and technical standards that are consistent with the requirements of United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Wildlife (CDFW).

Chambers Group, Inc. (Chambers Group) was retained by LACDPW to conduct a literature review and reconnaissance-level survey for the proposed Project. During the survey, biologists identified vegetation communities, determined the potential for the occurrence of sensitive species and habitats that could support sensitive wildlife species onsite, and recorded all plants and animals observed or detected within the Project boundary.

1.1 PROJECT LOCATION AND ENVIRONMENTAL SETTING

Pacoima Spreading Grounds is located in the City of Los Angeles near the intersection of Paxton and Arleta streets on the west side of Pacoima Diversion Channel (Figure 1). The project site is immediately west of Interstate 5 (I-5) and south of California State Route (SR) 118. It is located on the United States Geological Survey (USGS) *San Fernando* 7.5-minute topographic quadrangle. Elevation in the survey area ranges from 905 to 950 feet above mean sea level (amsl). Pacoima Spreading Grounds covers approximately 169 acres in area. The facility is bordered by Filmore Street, Woodman Avenue, San Jose Street, and Arleta Avenue and is bisected by Devonshire Street. The spreading grounds are hydraulically connected by pipes underneath Arleta Avenue and Devonshire Street.

The survey area is approximately 169 acres and includes the Pacoima Spreading Grounds vicinity (Figure 1). The survey area is located in a highly developed area surrounded by private residences, local businesses, and other open space including Devonwood Park (to the west of proposed Project site) and Devonshire Arleta Park (to the east of proposed Project site). Devonwood Park includes a children's play area and picnic tables.

Habitat in the survey area is composed primarily of ruderal, developed, disturbed, and ornamental landscaping vegetation communities (Figure 2). Sandy loam and clay loam soils are present within the Project area.

SECTION 2.0 – METHODOLOGY

2.1 LITERATURE REVIEW

A literature review of the survey area was conducted prior to performing the reconnaissance survey. The most recent records of the California Natural Diversity Database (CNDDB; managed by CDFW 2013) and the California Native Plant Society's Electronic Inventory (CNPSEI) of Rare and Endangered Vascular Plants of California (CNPS 2013) were reviewed for the quadrangles containing and surrounding the Project site, including the *San Fernando, Sunland, Burbank, Oat Mountain,* and *Van Nuys*, California, USGS 7.5-minute quadrangles. These databases contain records of reported occurrences of federally or state listed as endangered or threatened species, proposed endangered or threatened species, California Species of Concern (SSC), or otherwise sensitive species or habitats that may occur within or in the immediate vicinity of the Project site.

2.2 SOILS

Before the survey was conducted, soil maps for Los Angeles County were referenced online (http://soils.usda.gov/technical/classification/osd/index.html) to determine the types of soil found within the Project site. Soils were determined in accordance with categories set forth by the United States Department of Agriculture (USDA) Soil Conservation Service and by referencing the USDA Natural Resources Conservation Service (NRCS) Web Soil Survey (USDA 2013).

2.3 BIOLOGICAL RECONNAISSANCE-LEVEL SURVEY

Chambers Group biologists Heather Franklin and Jeremy Smith conducted the general reconnaissance survey to map vegetation communities and identify the potential for occurrence of sensitive plant and wildlife species and habitats that could support sensitive wildlife species on site. All plants and animals observed or detected on site were recorded. The survey was conducted on foot throughout the Project site between the hours of 8:00 a.m. and 12:00 p.m. on May 13, 2013. Weather conditions during the survey included temperatures ranging from 80 to 87 degrees Fahrenheit with zero percent cloud cover and no precipitation. Photographs of the Project site were taken to document existing site conditions and are provided in Appendix A.

2.3.1 Vegetation

All plant species observed within the Project site were recorded. Vegetation communities within the Project site were identified, qualitatively described, and mapped onto an aerial photograph. Plant communities were determined in accordance with the categories set forth in Holland (1986), Gray and Bramlet (1992), or Sawyer et al. (2009). Plant nomenclature follows that of Baldwin et al. (2012). A comprehensive list of the plant species observed during the survey is provided in Appendix B.

2.3.2 Wildlife

All wildlife and wildlife signs observed and detected, including tracks, scat, carcasses, burrows, excavations, and vocalizations, were recorded. Additional survey time was spent in those habitats most likely to be utilized by wildlife (undisturbed native habitat, wildlife trails, etc.), and in habitats with the potential to support state and/or federally listed or otherwise sensitive species. Notes were made on

the general habitat types, species observed, and the conditions of the Project site. A comprehensive list of the wildlife species observed or detected during the survey is provided in Appendix C.

SECTION 3.0 – RESULTS

3.1 SOILS

After review of USDA Soil Conservation Service and by referencing the USDA Natural Resources Conservation Service (NRCS) Web Soil Survey (USDA 2013), it was determined that the Project site is located within the West San Fernando Valley Area (CA676). Based on the results of the database search, no soil data exists for this area; however, sandy loam and clay loam were observed within the site during the survey.

3.2 VEGETATION COMMUNITIES

Surveys of the Project site identified four vegetation communities: Ruderal, Developed, Disturbed, and Ornamental Landscaping. A map showing the vegetation communities observed within the Project site is provided as Figure 2. Representative site photographs were taken documenting the vegetation communities of the site (Appendix A). A total of 47 plant species were observed within the Project site (Appendix B).

3.2.1 Ruderal

Ruderal vegetation communities are dominated by non-native, weedy species that are adapted to frequent disturbances. Soils in ruderal areas are also typically characterized as heavily compacted. Species observed in this community onsite include common knotweed (*Polygonum arenastrum*), English plantain (*Plantago lanceolata*), and white sweetclover (*Melilotus alba*). The Project area includes 126.5 acres classified as Ruderal vegetation.

3.2.2 Developed

Developed areas are those that have been altered by humans and display man-made structures such as houses, paved roads, buildings, or parks. Developed areas found within the Project site include paved and graded roads. The Project area includes 15.1 acres classified as Developed.

3.2.3 Disturbed

Disturbed areas are often barren and lack vegetation due to clearing or grading. These areas are often dominated by pioneer herbaceous species that readily colonize disturbed ground, such as prickly sow-thistle (*Sonchus asper*) and wild lettuce (*Lactuca serriola*) (Gray and Bramlet 1992). Examples of plant species observed in the Project site include wild lettuce, prickly sow-thistle, and common sow-thistle (*Sonchus oleraceus*). The Project area includes 0.70 acre classified as Disturbed.

3.2.4 Ornamental Landscaping

Ornamental Landscaping includes areas where the vegetation is dominated by non-native horticultural plants (Gray and Bramlet 1992). Typically, the species consist of introduced trees, shrubs, flowers, and turf grass. Examples of Ornamental plant species found on the Project site include non-native pine, eucalyptus trees, and palm trees. The Project Area includes 4.5 acres of Ornamental Landscaping.

3.3 SENSITIVE SPECIES

The following information is a list of abbreviations used to help determine the significance of biologically sensitive resources potentially occurring within the Project site.

California Rare Plant Rank (CRPR)

List 1A = Plants presumed extinct in California.
List 1B = Plants rare and endangered in California and throughout their range.
List 2 = Plants rare, threatened, or endangered in California but more common elsewhere in their range.
List 3 = Plants about which we need more information; a review list.
List 4 = Plants of limited distribution; a watch list.

CRPR Extensions

0.1 = Seriously endangered in California (greater than 80 percent of occurrences threatened/high degree and immediacy of threat).
0.2 = Fairly endangered in California (20-80 percent occurrences threatened).
0.3 = Not very endangered in California (less than 20 percent of occurrences threatened).

Federal

FE = Federally listed; Endangered
FT = Federally listed; Threatened
FC = Federal Candidate for listing

State

ST = State listed; Threatened
SE = State listed; Endangered
RARE = State-listed; Rare (Listed "Rare" animals have been re-designated as Threatened, but Rare plants have retained the Rare designation.)
SSC = State Species of Special Concern
WL = CDFW Watch List

The criteria used to evaluate the potential for sensitive species to occur within the Project site are outlined in Table 1, below.

Table 1: Criteria for Evaluating Sensitive Species Potential for Occurrence

PFO*	CRITERIA
Absent:	Species is restricted to habitats or environmental conditions that do not occur within the Project site.
Low:	Historical records for this species do not exist within the immediate vicinity (approximately 5 miles) of the Project site, and/or habitats or environmental conditions needed to support the species are of poor quality.
Moderate:	Either a historical record exists of the species within the immediate vicinity of the Project site (approximately 5 miles) and marginal habitat exists within the site; or the habitat requirements or environmental conditions associated with the species occur within the Project site, but no historical records exist within 5 miles of the site.
High:	Both a historical record exists of the species within the Project site or its immediate vicinity (approximately 5 miles), and the habitat requirements and environmental conditions associated with the species occur within the site.
Present:	Species was detected within the site at the time of the survey.

* PFO: Potential for Occurrence

3.3.1 Sensitive Plants

Current database searches (CDFW 2013 and CNPS 2013) resulted in a list of 17 federal- and/or state-listed threatened and endangered or rare sensitive plant species documented to occur within the vicinity of the Project site. After the literature review, the assessment of the various habitat types in the area of the site, and the reconnaissance survey, it was determined that all 17 species are absent from the Project site. Factors used to determine the potential for occurrence included the quality of habitat, elevation, the location of prior CNDDB records of occurrence, and the results of reconnaissance survey.

The following 17 plant species are considered **Absent** from the Project site due to lack of suitable habitat and/or the species is found outside the elevation range:

- Parish's brittlescale (*Atriplex parishii*) – CRPR List 1B.1
- Nevin's barberry (*Berberis nevinii*) – **FC, CE,** CRPR List 1B.1
- round-leaved filaree (*California macrophylla*) – CRPR List 1B.1
- slender mariposa-lily (*Calochortus clavatus* var. *gracilis*) – CRPR List 1B.2
- Plummer's mariposa-lily (*Calochortus plummerae*) – CRPR List 4.2
- southern tarplant (*Centromadia parryi* ssp. *australis*) – CRPR List 1B.1
- San Fernando Valley spineflower (*Chorizanthe parryi* var. *fernandina*) – **FC, CE,** CRPR List 1B.1
- Santa Susana tarplant (*Deinandra minthornii*) – **CR,** CRPR List 1B.2
- slender-horned spineflower (*Dodecahema leptoceras*) – **FE, CE,** CRPR List 1B.1
- many-stemmed dudleya (*Dudleya multicaulis*) – CRPR List 1B.1
- Palmer's grapplinghook (*Harpagonella palmeri*) – CRPR List 4.2
- mesa horkelia (*Horkelia cuneata* var. *puberula*) – CRPR List 1B.1
- Robinson's pepper-grass (*Lepidium virginicum* var. *robinsonii*) – CRPR List 1B.2
- Davidson's bush-mallow (*Malacothamnus davidsonii*) – CRPR List 1B.2
- California Orcutt grass (*Orcuttia californica*) – **FE, CE,** CRPR List 1B.1

- white rabbit-tobacco (*Pseudognaphalium leucocephalum*) – CRPR List 2.2
- Greata's aster (*Symphyotrichum greatae*) – CRPR List 1B.3

3.3.2 Sensitive Wildlife

A current database search (CDFW 2013) resulted in a list of 25 federally and/or state listed endangered or threatened, Species of Concern, or otherwise sensitive wildlife species that may potentially occur within the Project site. After a literature review and the assessment of the various habitat types within the Project site, it was determined that all 25 sensitive wildlife species were considered absent from the site.

The following 25 wildlife species are considered **Absent** from the Project site due to lack of suitable habitat present or because no record shows the existence of these species within 5 miles of the Project site:

- pallid bat (Antrozous pallidus) - SSC
- western pond turtle (Emys marmorata [Actinemys marmorata pallida]) - SSC
- arroyo chub (*Gila orcuttii*) - SSC
- Santa Ana speckled dace (*Rhinichthys osculus* ssp. *3*) - SSC
- Los Angeles pocket mouse (*Perognathus longimembris brevinasus*) - SSC
- Sierra Madre yellow-legged frog (*Rana muscosa*) - FE, SSC
- silvery legless lizard (*Anniella pulchra pulchra*) - SSC
- southern rubber boa (*Charina umbratica*) - ST
- San Bernardino mountain kingsnake (*Lampropeltis zonata parvirubra*) -SSC
- southern grasshopper mouse (*Onychomys torridus ramona*) - SSC
- two-striped garter snake (*Thamnophis hammondii*) - SSC
- western yellow-billed cuckoo (*Coccyzus americanus occidentalis*) - SE
- southwestern willow flycatcher (*Empidonax traillii extimus*) - FE, SE
- western mastiff bat (*Eumops perotis californicus*) - SSC
- western yellow bat (*Lasiurus xanthinus*) - SSC
- San Diego black-tailed jackrabbit (*Lepus californicus bennettii*) - SSC
- California leaf-nosed bat (*Macrotus californicus*) - SSC
- San Diego desert woodrat (*Neotoma lepida intermedia*) - SSC
- big free-tailed bat (*Nyctinomops macrotis*) - SSC
- coast horned lizard (*Phrynosoma blainvillii*) - SSC
- California gnatcatcher (*Polioptila californica californica*) - FT, SSC
- western spadefoot (*Spea hammondii*) - SSC
- American badger (*Taxidea taxus*) - SSC
- least Bell's vireo (*Vireo bellii pusillus*) - FE, SE
- burrowing owl (*Athene cunicularia*) – SSC

3.4 GENERAL PLANTS

A total of 47 plant species were observed during the survey. Plant species observed during the survey represent the characteristics of the existing site conditions. No sensitive plant species were observed during the survey. A complete list of plants observed was recorded during the survey (Appendix B).

3.5 GENERAL WILDLIFE

A total of 23 wildlife species was observed during the survey. One active killdeer nest was observed just outside the southeast corner of the boundary of the western portion of the Project site (located on the west side of Arleta Ave). Four eggs were observed in a nest on the ground at the base of a eucalyptus tree located within the paved portion of the area. Wildlife species observed or detected during the survey were characteristic of the existing site conditions. No sensitive wildlife species were observed during the survey effort. A complete list of wildlife observed or detected was recorded during the survey (Appendix C).

3.6 MIGRATORY BIRD TREATY ACT, AS AMENDED (16 USC 703-711)

In order to comply with the Migratory Bird Treaty Act (MBTA), any vegetation clearing should take place outside the general bird breeding season (February 14 to September 1), to the maximum extent practical. If this is not possible, prior to ground-disturbing activities, a qualified biologist should conduct and submit a migratory nesting bird and raptor survey report. The survey should occur no more than three days prior to initiation of Project activities, and any occupied passerine and/or raptor nests occurring within or adjacent to the study area should be delineated. Additional follow-up surveys may be required by the resource agencies. To the maximum extent practicable, a minimum buffer zone around occupied nests should be maintained during physical ground-disturbing activities. The buffer zone should be sufficient in size to prevent impacts to the nest. Once nesting bird season has ceased, the buffer may be removed.

SUMMARY OF FINDINGS (ABSTRACT)

Chambers Group, Inc. (Chambers Group) was retained by the Los Angeles County Department of Public Works (LACDPW) to conduct a cultural resources records search and background literature review for the Pacoima Spreading Grounds Improvement Project (Project), located in the City of Los Angeles, Los Angeles County, California (Figure 1). This report includes the methods and results of the cultural resources records search, background literature review, and significance evaluation provided by Chambers Group.

The subject property is a heavily altered water management facility originally installed at the site in the early 1930s. LACDPW proposes to increase the storage capacity and simplify operations by combining basins and constructing new inter-basin structures. Recharge basins will be reconfigured and deepened. The proposed Project will also modernize the existing intake structures and increase retention capacity of the spreading grounds. The existing intake structure will be replaced, and pipes will be extended from the headworks to the culverts to restrict intake to the design flow rate of 600 cubic feet per second (cfs) and eliminate the potential for overtopping. The Project involves ground disturbance.

To determine the potential presences of cultural resources within the Project area, an extensive remote investigation was implemented per California Environmental Quality Act (CEQA) guidelines. In addition to research and Native American consultation, field images taken by Chambers Group staff were analyzed to determine the level of integrity for any historic-period properties and the potential for significance of the subject property. Using records search results and additional background information, a determination of impacts to cultural resources, including archaeological and historic architectural resources, was completed.

Since no cultural resources appear to be present within or adjacent to the Project area, the Pacoima Spreading Grounds Improvement Project is not anticipated to impact cultural resources. Nevertheless, since the project involves ground disturbance, the potential to uncover subsurface resources remains. In the event such a discovery is made, it is recommended that Project activity be halted until a qualified Cultural Resource Specialist can evaluate the potential resource.

SECTION 1.0 – PROJECT DESCRIPTION

Chambers Group, Inc. (Chambers Group) was retained by the Los Angeles County Department of Public Works (LACDPW) to conduct a cultural resources records search and background literature review to support California Environmental Quality Act (CEQA) documentation for the proposed actions relating to the Pacoima Spreading Grounds Improvement Project (Project), located in the City of Los Angeles, Los Angeles County, California (Figure 1). This report includes the methods and results of the cultural resources records search, background literature review, and significance evaluation provided by Chambers Group.

The Project area for the Pacoima Spreading Grounds is located near the intersection of Paxton and Arleta streets, on the west side of the Pacoima Diversion Channel (Figure 2). The facility consists of 12 large, shallow basins with a storage capacity of 530 acre-feet (af) and is one of the major water conservation facilities that recharge the San Fernando Basin.

The proposed improvements will increase the storage capacity and simplify operations by combining basins and constructing new interbasin structures. The Project will optimize the recharge capacity of the spreading grounds by modernizing and automating the existing intake structures and improving the spreading basins to increase retention capacity. The existing intake structure will be improved by replacing the current intake canal with four 54-inch diameter reinforced concrete pipes (RCPs). The pipes will extend from the headworks to the culverts that convey water to the spreading basins. After the pipes are installed, the intake channel will be backfilled with approximately 27,850 cubic yards (cy) of sediment removed from the spreading basins. Due to the variability of uncontrolled flows in Pacoima Diversion Channel, careful operation of the radial gate is currently required to regulate flows into the intake canal. When flows in excess of 600 cfs enter the intake canal, water can potentially overtop the intake canal, resulting in localized flooding. Replacing the intake canal with pipes will restrict the intake to the design flow rate of 600 cfs and eliminate the potential for overtopping the intake canal.

The recharge basins will be reconfigured and deepened to allow for greater percolation and capacity (see Figure 3). Approximately 1.6 million cy of sediment will be excavated in order to completely remove the underlying clay layers; however, only 1.37 million cy of sediment will be exported from the site. The remainder of the sediment will be used to backfill the existing intake channel or be returned to the spreading basins to bring the basin inverts up to their finished elevation.

The purpose of this study is to provide information and analysis to determine whether the Project will have the potential to cause substantial adverse change or impacts to properties eligible for or listed in the California Register of Historical Resources (CRHR). The purpose of the CRHR is to maintain listings of the state's historical resources and to indicate which properties are to be protected, to the extent prudent and feasible, from material impairment and substantial adverse change. This study was conducted in compliance with the provisions of CEQA, including the CEQA Statutes (Public Resources Code [PRC] §§ 21083.2 and 21084.1), the CEQA Guidelines (Title 14 California Code of Regulations [CCR], § 15064.5), and PRC § 5024.1 (Title 14 CCR § 4850 et seq.). These statutes and regulations, as amended, are summarized in an annually updated handbook (Association of Environmental Professionals 2012). Properties expected to be directly or indirectly impacted by a proposed project must be evaluated for CRHR eligibility (PRC § 5024.1).

CHAMBERS GROUP

SECTION 2.0 – METHODS: RESEARCH AND REVIEW

2.1 RECORDS SEARCH

Chambers Group Cultural Resources Specialist Clarence Bodmer conducted the cultural resources records search and literature review on May 7, 2013, at the South Central Coastal Information Center (SCCIC) located on the campus of California State University, Fullerton. The SCCIC houses records of the California Historical Resources Information System (CHRIS) for Los Angeles and Ventura counties. The records search included a half-mile (0.8-km) radius around the Project area. The purpose of the records search and background literature review was to identify any prehistoric or historic archaeological sites or historic buildings and structures previously recorded within a half-mile radius of the Project area. Mr. Bodmer also reviewed the National Register of Historic Places (NRHP) and Archaeological Determinations of Eligibility as well as historic maps for the presence of possible historic structures or archaeological site locations.

The purpose of reviewing the records was to:

1. identify cultural resources within the Project area and the surrounding vicinity,

2. identify and determine the adequacy of previously conducted cultural resources studies in the Project area,

3. develop management recommendations for cultural resources within the study area, and

4. assess what additional cultural resources studies would need to be undertaken for the Project.

2.2 NATIVE AMERICAN HERITAGE COMMISSION

In addition to the records search conducted at the SCCIC, a letter was sent to the State of California's Native American Heritage Commission (NAHC) on May 1, 2013, requesting a search of their Sacred Lands Inventory. The NAHC provided Chambers Group with a list of Native American contacts that may have knowledge of cultural resources near the Project area. Chambers Group contacted each of the NAHC-listed contacts, requesting information related to any Native American cultural resources within the study area.

2.3 RESEARCH METHODS

Investigators also executed general contextual and site-specific research for the subject property and the Project area. Sources used to conduct this research effort include the Los Angeles County Department of Public Works, the City of Los Angeles Planning Department, the Los Angeles City Historical Society, California State University, Northridge online resources, and Los Angeles Public Library databases. Additionally, investigators consulted the California Department of Transportation (Caltrans) Historic Bridge Survey, California Historic Resources Inventory, and NPS Focus Digital Library and Resources to determine if any properties had been previously surveyed or evaluated.

SECTION 3.0 – RESULTS: RESEARCH AND REVIEW

3.1 RECORDS SEARCH

Results of the records search conducted at the SCCIC indicate that the Project area had not been previously surveyed for cultural resources. The records search did identify 11 cultural resources studies performed between 1994 and 2011 that fall within the half-mile study area (Table 1). These studies consisted of cultural resource inventory surveys and records searches for various highway and infrastructure improvement projects, housing developments, telecommunications installations, water reclamation projects, and community redevelopment programs. None of the previous resource studies are located within the Project area; and no prehistoric or historic-period cultural resources or historic buildings or structures are located within the designated half-mile study area, as indicated by the available records search information.

Despite the lack of previously recorded resources in the study area, since the Pacoima Spreading Grounds facility was originally constructed in the early 1930s, the subject property is the appropriate age (greater than 50 years old) to warrant a historical resource evaluation. In addition to the age requirement, to be considered a CRHR-eligible historical resource, a property must meet one of the following four criteria:

Criterion 1: It is associated with events that have made a significant contribution to the broad patterns of history and cultural heritage;

Criterion 2: It is associated with the lives of persons important in the past;

Criterion 3: It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic value; or

Criterion 4: It has yielded or is likely to yield information important in prehistory or history.

As such, a historical significance evaluation for the property is summarized below, and a formal evaluation is included in Appendix A of this document.

Table 1: Prior Cultural Resources Studies within the Half-Mile Study Area

Mr. Bodmer reviewed the current inventories of the National Register of Historic Places (NRHP), the California Register of Historical Places (CRHP), the California Historical Landmarks (CHL), and the California Points of Historical Interest (CPHI). No historic properties located within the Project area were found on the NRHP, CRHP, CHL, or the CPHI. The California State Historical Resources Inventory for Los Angeles County was also reviewed to determine if any local resources had been previously evaluated for historical significance. No historical resources were found as a result of this additional research.

3.2 NATIVE AMERICAN HERITAGE COMMISSION

The NAHC responded to Chambers Group's inquiry on May 20, 2013, indicating that a search of their Sacred Lands files failed to support the presence of Native American traditional cultural places in the Project area. The NAHC noted, however, that the area is known to be culturally-sensitive, indicating that cultural resources have previously been uncovered in the general vicinity or region. As such, the NAHC advised Chambers Group to contact other entities familiar with cultural resources in the area. As a result, seven Native American tribes, individuals, and representatives who may have knowledge of cultural resources within or near the Project area were contacted. As of this writing, no response has been received from any of the letter recipients. Sample inquiry letters sent to the contacts can be found in Appendix B of this document.

3.3 LITERATURE REVIEW

The literature review for the Project area and the surrounding vicinity indicates that the Project is located in the ethnographic area associated with the Gabrieliño (Tongva) of the Los Angeles, San Gabriel, Rio Hondo, and Santa Ana river drainages. The Gabrieliño is a Late Prehistoric/Proto-historic group of the Shoshonean language stock (Kroeber 1925; Johnston 1962). The term "Gabrieliño" is a reference to the direct association between the Native American population of the San Gabriel Valley and the Mission San Gabriel de Archangel.

At the time of European contact, the Gabrieliño occupied the Los Angeles Basin, the San Fernando Valley, the coast from Aliso Creek in Orange County north to Topanga Canyon, and three of the southern Channel Islands off the coast of southern California (Bean and Smith 1978; Harrington 1962; Kroeber 1953; McCawley 1996).

Bean and Smith (1978) stated that probably between 50 to 100 mainland villages were led by a chief or *tomyaar*, each with a population of approximately 50 to 100 inhabitants. Numerous plants and animals were utilized for food and shelter. Along with depending on small game, inland villages relied on acorns and other plant resources for subsistence as well as for medicine. Before the establishment of the mission system implemented by the Spanish, Gabrieliño tended to occupy large villages while also using "satellite" sites with much smaller population numbers and more limited subsistence activities. Gabrieliño territory ranged from the coastline to the foothills of the San Gabriel Mountains, providing the tribe with diverse environments and resources to exploit. This in turn fostered regional and long-distance trade networks. Trade was conducted among Gabrieliño and coastal groups such as the Chumash and Juaneño as well as interior groups like the Kitanemuk and Serrano.

SECTION 4.0 – HISTORICAL OVERVIEW

4.1 EARLY DEVELOPMENT OF THE CITY OF LOS ANGELES

By the 1770s, Spanish padres had established a series of missions throughout Alta California. During this time, the Project area was located within the boundaries of lands held by the Mission San Gabriel de Archangel. These expansive holdings encompassed hundreds of acres, stretching across San Fernando Valley. Nine miles away, the Pueblo of Los Angeles was officially founded in 1781. Similar to the Project area, for the first 40 years following the pueblo's establishment, the settlement was considered under authority of the Spanish crown.

When Mexico gained independence from Spain in 1821, the new government began a process of secularization of the large tracts of land once under the authority of the Church under the mission system. At this time the young pueblo of Los Angeles held the largest population in Alta California and was increasingly seen as the regional center for politics, religion, economy, and culture.

Despite the change in governments, the Alta California economy continued to grow during the Mexican Period (1821-1848). Between 1833 and 1834, most of the mission lands were removed from church control and redistributed through grants to individuals, including those who served as Spanish or Mexican soldiers, settlers, and financiers. This redistribution was done to encourage populations to settle in Alta California (Hanna 1951; McWilliams 1973; Dumke 1944; Scott 1977). The Project area is located within one such Mexican land grant, the Rancho Ex-Mission de San Fernando. The Rancho Ex-Mission de San Fernando was established after the secularization of the California missions, with the Pacoima area occupied by sheep ranches and wheat fields.

4.2 DEVELOPMENT OF THE COMMUNITY OF PACOIMA

It was not until 1873 when Senator Charles Maclay of Santa Clara purchased approximately 56,000 acres of land in the northern part of the San Fernando Valley adjacent to the old Ex-Mission de San Fernando Rancho that the town of San Fernando was founded. Jouett Allen, an early settler in the area, purchased approximately 1,000 acres of land between the Pacoima Wash and the Tujunga Wash and retained 500 acres of land for himself and subdivided the remainder into 1-acre tracts. From these subdivided lands, the community of Pacoima was founded in 1887. With the arrival of the railroads in the 1870s and 1880s, the area became accessible to settlers from the Los Angeles area as well as from the east coast. To accommodate this growth, the community was centered around the Southern Pacific Railroad Station.

At the turn of the twentieth century, Pacoima was a rural, agricultural area containing olive groves, peach and apricot orchards, orange and lemon groves, alfalfa fields, and chicken ranches. Until World War II, the area remained a community dotted by small farms, vineyards, and orchards. After the war, the population of the area rose; and the community became increasingly more suburban, serving as a bedroom community to the fast-growing industries in Los Angeles and nearby Glendale and Burbank.

4.3 PROJECT AREA - PACOIMA SPREADING GROUNDS

Construction for the Pacoima spreading grounds began in the early 1930s. The first season of operation of the Pacoima Spreading Grounds was 1932-1933 (LADPW 2013). The purpose of the spreading grounds was to control the flow of water from the canyons and storm water runoff and to recharge groundwater

through the use of permeable basins. Today, the source of water for the spreading grounds comes from controlled flows from Pacoima Dam, partially controlled flow from Lopez Flood Control Basin, uncontrolled flow from East Canyon and Pacoima Wash, and imported water (LADPW 2013). Based on the 1932 construction plans, lateral canals were used to distribute water over the spreading grounds. These laterals branched off two primary canals, the East Canal and the West Canal. Together the canals helped distribute the flow of water and assist its absorption into the ground.

Since the original construction of the property, the Pacoima Spreading Grounds have undergone significant alterations. Beginning in the 1950s, the headworks were modified to improve efficiency of the system. Then, in the late 1980s, the facility underwent considerable alterations when modifications were made to the levees and excavations were undertaken to allow for deeper basins.

During the investigation, as-built drawings from 1932, 1953, and 1986 were examined to discern the extent of modifications made to the historic-period Pacoima Spreading Grounds. This examination indicated significant alterations to the facility including:

- Improvements/alterations to the headworks and associated gates
- Construction of Devonshire Street, bisecting the original spreading grounds
- Removal of several levees and diversion structures
- Excavations to increase the capacity of the spreading grounds by deepening the basins
- Installation of weir structures and removal of some existing timber and concrete drop structures
- Installation of modern catwalk, gratings, and handrails

According to historic aerial images, it appears that, while the Pacoima Spreading Grounds facility remains in generally the same location, the form and massing of the property have changed significantly since its original construction. An image from 1953 depicts the spreading grounds as a contiguous property with an irregular footprint, surrounded by agricultural lands and limited residential development. By the 1969 aerial image, the spreading grounds are bisected by the installation of Devonshire Street. Also that year, extensive residential development appears to have enveloped the subject property on all sides. According to the available images, the most dramatic change to the form of the property happened between 1982 and 2003. As confirmed through background research and noted above, in the late 1980s the layout of the subject property was dramatically reconfigured and modernized. Aerial photographs depict the spreading grounds shifting from a collection of approximately 25 relatively small collection basins to about 12 large individual reservoirs. Concrete overflow spillways and earthen levees were added to the subject property as part of the 1980s alterations (Historic Aerials 2013).

As a result of the gradual yet significant modifications described above, the exact percentage of the original 1930s spreading grounds built environment features that remain could not be determined. To analyze any remaining historic integrity or potential historical significance of the Pacoima Spreading Grounds, a formal evaluation of the subject property was undertaken. The results of the evaluation were summarized in the conclusions of this report and were recorded on the appropriate DPR 523 Series forms, included in Appendix A of this document.

SECTION 5.0 – DESCRIPTION OF HISTORICAL RESOURCES

The proposed Project site is located in an urbanized area and currently consists of a municipal facility used in water management by the San Fernando Valley. Immediately adjacent to the northwest side of the facility is the concrete-lined Pacoima Diversion Channel, which transports water into the Pacoima Spreading Grounds. The remaining sides of the subject property are filled with a combination of single and multi-family residences as well as roadways, including Arleta Avenue and Fillmore Street. Devonshire Street bisects the subject property and runs roughly east to west. Overhead street lights and non-historic-period signage line the surrounding streets.

Consistent with CEQA guidelines, a remote study was undertaken to identify historical resources within the area of potential effect and consider possible impacts that may alter any of the characteristics of a historic-period property that might qualify it for inclusion in the CRHR. As such, the Pacoima Spreading Grounds were formally evaluated for CRHR-eligibility (See Appendix A). According to records search results, the spreading grounds were not previously evaluated for potential significance. After close examination, it appears the subject property does not demonstrate a level of significance or appear to meet the criteria of eligibility for inclusion in the CRHR based on its current appearance and form. Therefore, it is determined that no historical resources are present within the area of potential effect (APE) for this Project.

The subject property consists of a series of 12 shallow basins used in water management to allow excess water capacity to more easily percolate down to the subsurface water table. Sources of the water include controlled flow from Pacoima Dam, partially controlled flow from the Lopez Flood Control Basin, uncontrolled flow from East Canyon and Pacoima Wash, and imported water. The basins of the approximately 107-acre property are fed water from the Pacoima Wash Channel, which has a design capacity of approximately 17,000 cfs.

Originally installed in the early 1930s, the spreading grounds have been significantly altered since initial construction. These alterations include deepening and reconfiguring the basins, improvements to the headworks and floodgates, and the removal of several levees and diversion structures.

SECTION 6.0 – FINDINGS AND CONCLUSIONS

The results of the cultural resources records search and background literature review for the Pacoima Spreading Grounds Improvement Project did not identify any previously recorded prehistoric or historic archaeological sites or historic buildings or structures within the Project area or within the half-mile radius of the study area.

Upon examination of the alterations to the spreading grounds, the historic integrity of the property appears to have been significantly undermined. According to the available records, including as-built drawings for the facility and its alterations, significant modifications to the spreading grounds have taken place since the 1930s that have affected the property's ability to convey a level of historical significance to warrant eligibility for listing to either the state or national registers. As a result, the subject property does not demonstrate a level of significance or appear to meet the criteria of eligibility for inclusion in the CRHR based on its current appearance and form. Due to the property's previous loss of integrity, the Pacoima Spreading Grounds Improvement Project is not anticipated to result in an impact to any historical resources.

As noted in the formal evaluation, included as Appendix A of this document, Chambers Group does not recommend the Pacoima Spreading Grounds as eligible for listing to the CRHR or the NRHP or for consideration as a historical resource for purposes of CEQA.

Despite these findings, it should be noted that, based upon the research methods detailed in this report, the absence of cultural resources within the Project area does not preclude the possible presence of undiscovered cultural resources which may lie subsurface. In the event cultural resources are discovered during the course of construction activities associated with this Project, a Cultural Resource Specialist who meets the *Secretary of the Interior Professional Qualifications Standards* (National Park Service 1983) should evaluate the potential significance of the materials under CEQA. If the discovery proves to be significant, additional work, such as data recovery excavation, may be warranted and should be discussed in consultation with the lead agency, the Los Angeles Department of Water and Power (LADWP).

SECTION 8.0 – PREPARER'S QUALIFICATIONS

Joel Levanetz, MA, Lead Architectural Historian

Mr. Levanetz is a Secretary of the Interior Professional Qualified Architectural Historian. During his eight years of experience, Mr. Levanetz has applied his knowledge and ability to a range of projects, including historic survey reports, historic resources assessments, Historic American Building Survey (HABS)/Historic American Engineering Record (HAER) documentation, and DPR 523 series form preparation.

Mr. Levanetz possesses a detailed understanding of relevant regulations and ordinances that affect historic properties, such as Sections 106 and 110 of National Historic Preservation Act (NHPA), the National Environmental Protection Act (NEPA), the California Environmental Quality Act (CEQA), and the Secretary of Interior Standards for the Treatment of Historic Properties. He has applied this understanding to a breadth of historic assessments and determinations of eligibility across a range of administrative levels including local, state, and National Register of Historic Places (NRHP). Among the agencies served by Mr. Levanetz are the Department of Defense (DOD), Federal Emergency Management Agency (FEMA), Bureau of Land Management (BLM), California Energy Commission (CEC), Federal Communications Commission (FCC), Federal Aviation Administration (FAA), Department of Housing and Urban Development (HUD), California Department of Transportation (Caltrans), as well as countless local agencies and private clients.

BUILDING, STRUCTURE, AND OBJECT RECORD

***NRHP Status Code:**

***Resource Name or #** (Assigned by recorder) Pacoima Spreading Grounds

B1. Historic Name: Pacoima Spreading Grounds
B2. Common Name: Pacoima Spreading Grounds
B3. Original Use: Water Management
B4. Present Use: Water Management

***B5. Architectural Style:** Utility

***B6. Construction History:** (Construction date, alterations, and date of alterations)

The Pacoima Spreading Grounds were originally built in the early 1930s. Since this initial construction, the facility has undergone a number of significant alterations. Beginning in the 1950s, the headworks were modified to improve efficiency of the system. In the late 1980s, the facility underwent considerable alterations when modifications were made to the levees and excavations were undertaken to allow for deeper basins.

Refer to the accompanying Continuation Sheet for a detailed Construction History.

***B7. Moved?** ■No ☐Yes ☐Unknown **Date:** NA **Original Location:** NA

***B8. Related Features:**

The Pacoima Diversion Channel adjacent to the southeastern edge of the property.

B9a. Architect: Unknown
b. Builder: Unknown

***B10. Significance: Theme:** NA **Area:** NA

Period of Significance: NA **Property Type:** Municipal **Applicable Criteria:** NA

(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

The historical significance of the Pacoima Spreading Grounds was determined by applying the procedure and criteria for the California Register of Historical Resources (CRHR) as well as the National Register of Historic Places (NRHP).

Based on the remote investigation and historic research, the Pacoima Spreading Grounds facility does not appear to possess the requisite significance to be eligible for listing in either the CRHR or the NRHP and does not appear to be a historical resource for purposes of CEQA.

Refer to the accompanying Continuation Sheet for a detailed significance evaluation of the property.

***B6. Construction History (Continued):**

During the investigation, as-built drawings from 1932, 1953 and 1986 were examined to discern the extent of modifications made to the historic-period Pacoima Spreading Grounds. This examination indicated significant alterations to the facility including:

- Improvements/alterations to the headworks and associated gates
- Construction of Devonshire Street, bisecting the original spreading grounds
- Removal of several levees and diversion structures
- Excavations to increase the capacity of the spreading grounds by deepening the basins
- Installation of weir structures and removal of some existing timber and concrete drop structures
- Installation of modern catwalk, gratings, and handrails

***B10. Significance (Continued):**

The subject property was never previously evaluated for its historical significance for listing to the California Register of Historical Resources (CRHR) or the National Register of Historic Places (NRHP).

As a result of the current study, the property appears to be ineligible for listing to either the CRHR or the NRHP. Accordingly, after evaluating the project actions, it does not appear that the current undertaking will cause an impact or undermine the significance of any historic properties or impact historical resources for purposes of CEQA.

When constructed in the early 1930s, the Pacoima Spreading Grounds became an additional measure in a long history of water management strategies in the Los Angeles area. Throughout the 1800s the population swelled with settlers migrating to the region. By 1890, the population of Los Angeles County was recorded at 101,000. With consideration to this growing area, in 1892 President Benjamin Harrison established the Angeles National Forest. The 1.5 million acre preserve was created "primarily for the purpose of watershed protection and improvement of water flow conditions" (LADWP 2013).

Not long after, another significant water management development was implemented in response to the county's burgeoning population. In 1904, Superintendent of the Los Angeles City Water Company, William Mulholland, asserted that in order to sustain its residents, Los Angeles will require additional sources of water. Together with former mayor Frederick Eaton, Mulholland began developing a plan to transport water from Owens Valley to Los Angeles (LADWP 2013). After a contentious battle securing land and water rights, construction on the Los Angeles Aqueduct began in 1908. Just five years later, the project was completed and the 233-mile long aqueduct began delivering water from the Owens River in the Easter Sierra Mountains to Los Angeles.

However, concerns over water management did not end with the 1913 opening of the Los Angeles Aqueduct. In fact, the following year a dramatic flood caused catastrophic damage throughout the region and prompted the conversation about ways to manage the Los Angeles River. As such, in 1915 the Los Angeles Flood Control District was established with James A. Reagan leading the organization. Rather than take the advice of the County Board of Engineers to focus efforts on managing waters upstream to prevent flooding, Reagan pursued a program to channelize the Los Angeles River. Also under Reagan's management, the Devil's Gate Dam was constructed in 1920. This project represented the first dam built by the Los Angeles County Flood Control District, the agency that would ultimately become important divisions under the Department of Public Works.

In the 1930s, additional complications regarding water management in Los Angeles arose. Measurements indicated that groundwater levels, in some cases, were decreasing drastically. To simultaneously address flood risk and groundwater depletion, the Commission on Recreation and Parks and Beaches drafted a Comprehensive Plan that advised the purchase of lands in the flood plain to create, among other things, a series of settling grounds. The settling grounds would provide a facility to capture excess waters and absorb them in the subsurface aquifers (LADWP 2013).

***B10. Significance (Continued):**

Pacoima Spreading Grounds

Among the water management facilities created as a result of the 1930 Comprehensive Plan was the Pacoima Spreading Grounds. Operation of the spreading grounds began in 1932. As indicated above, the purpose of the facility was to control the flow of water from the canyons and storm water runoff as well as to recharge groundwater through the use of permeable basins. Currently, the source of water for the spreading grounds is controlled flow from Pacoima Dam, partially controlled flow from Lopez Flood Control Basin, uncontrolled flow from East Canyon and Pacoima Wash, and imported water.

Based on a review of the 1932 as-built drawings, lateral canals were originally used to distribute water over the spreading grounds. These laterals branched off two primary canals, the East Canal and West Canal. Together the canals helped distribute the flow of water and assist its absorption into the ground. However, since the initial construction of the property, the Pacoima Spreading Grounds have undergone significant alterations.

Beginning in the 1950s, the headworks were modified to improve efficiency of the system. Then, in the late 1980s, the facility underwent considerable alterations when modifications were made to the levees and excavations were executed to create deeper basins.

According to historic aerial images, it appears that, while the Pacoima Spreading Grounds remain in generally the same location, the form and massing of the property have changed significantly since the property's original construction. An image from 1953 depicts the spreading grounds as a contiguous property with an irregular footprint, surrounded by agricultural lands and limited residential development. By the 1969 aerial image, the spreading grounds are bisected by the installation of Devonshire Street. Also that year, extensive residential development appears to have enveloped the subject property on all sides. According to the available images, the most dramatic change to the form of the property happened between 1982 and 2003. As was confirmed through background research and noted above, in the late 1980s the layout of the subject property was dramatically reconfigured and modernized. Aerial photographs depict the spreading grounds shifting from a collection of approximately 25 relatively small collection basins to about 12 large individual reservoirs. Concrete overflow spillways and earthen levees were also added to the subject property as part of the 1980s alterations.

Upon review of the background literature and historical research, the Pacoima Spreading Grounds facility does not appear to meet the criteria of eligibility for inclusion to the CRHR or the NRHP and does not appear to be a historical resource for purposes of CEQA.

Criterion 1/A: Initial research indicated the property does not appear to be associated with significant events of the past. The Pacoima Spreading Grounds do not convey the importance of early water management strategies or the influence these strategies had in shaping the City of Los Angeles, the County of Los Angeles or the state of California.

Criterion 2/B: Historical research revealed that the property does not appear to be directly associated with the life and career of an individual who made important contributions to the history of the United States, California, or the Los Angeles region. Initial research failed to provide evidence establishing an association between persons of historical significance and the subject property.

***B10. Significance (Continued):**

Criterion 3/C: The Pacoima Spreading Grounds property is an example of a municipal facility that has been altered throughout the twentieth century. As such, it does not significantly embody the distinctive characteristics of a style, type or period of construction or engineering. Among the alterations that have significantly impacted the property are the 1950s modifications to the headworks and the 1980s reconfiguration of the levees and basins.

Criterion 4/D: Given the significant level of alterations to the subject property, it does not appear to have the potential to yield important information about the development of water management programs in the region.

Along with meeting one of the above criteria, in order for it to be eligible for listing in the national or state register, a property must also retain its historic integrity. The National Register of Historic Places recognizes a property's historic integrity through seven aspects or qualities. These include location, design, setting, materials, workmanship, feeling, and association. In order for a property to be eligible, it must retain some, if not most, of the aspects.

As defined by the Secretary of the Interior, location is the place where the historic-period property was constructed or the place where the historic event took place. Since the subject property has not been moved, it retains its integrity of location. However, no historic event was found to have taken place at the subject property. Design is defined as the composition of elements that constitute the form, plan, space, structure, and style of a property. The subject property has undergone numerous and significant changes since its original construction in the early 1930s. This includes non-historic period changes to the headgates as well as significant alterations to the basins and surrounding levees. Therefore, the property does not retain its integrity of design.

Setting is defined as the physical environment of a historic-period property that illustrates the character of the place. The property's setting has been heavily altered, changing from its original rural nature with surrounding open spaces to an urban character with moderate density housing. As a result, the property no longer retains its original historic appearance, visual narrative, or characteristics from the historic period. Therefore, the subject property does not retain its integrity of setting. Materials are defined as the physical elements combined in a particular pattern or configuration to form the aid during a period in the past. The property has been significantly altered with non-historic period additions and alterations. As such, the building no longer retains its integrity of materials.

Workmanship is defined as the physical evidence of the crafts of a particular culture or people during any given period of history. The property does not illustrate evidence of workmanship, and is not representative of a particular culture or people. Feeling is defined as the quality that a historic-period property has in evoking the aesthetic or historic sense of a past period of time. Given the property's significant loss of setting and design, the subject property does not retain its integrity of feeling. Association is defined as the direct link between a property and the event or person for which the property is significant. Research did not reveal an association between the property and persons or events significant to the past. Therefore, the subject property does not retain its integrity of association.

In conclusion, the property has lost its historic integrity of all aspects or qualities with the exception of location. However, the location of the Pacoima Spreading Grounds facility is not associated with a notable or recognized historic event. As a result, the subject property does not demonstrate a level of significance or appear to meet the criteria of eligibility for inclusion in the CRHR or the NRHP based on its current appearance and form. Due to the property's previous loss of integrity, the Pacoima Spreading Grounds Improvement Project is not anticipated to result in an impact to any historical resources or alter any of the characteristics of a historic-period property that qualify it for inclusion in the CRHR or NRHP. No historical resources are expected to be impacted as a result of the project.

Subject: **Chambers Group Project Number 20600: Record Search Request for the Pacoima Spreading Grounds Improvement Project, Los Angeles County, California**

Dear Mr. Singleton:

Chambers Group is requesting a review of the Sacred Lands Inventory be conducted for a study of the proposed Pacoima Spreading Grounds Improvement Project, near the intersection of Paxton and Arleta Streets, in the City of Los Angeles, Los Angeles County, California. At present, the proposed project includes the reconfiguration of the Pacoima Spreading Ground basin to increase the storage capacity from 530 to 1,197 acre-feet while removing clay to increase percolation rates. The proposed improvements will simplify operations by combining basins and constructing new interbasin structures, in addition to replacing a radial gate with a rubber dam.

The project area falls within an unsectioned portion of the Rancho Ex-Mission San Fernando Mexican land grant. Attached for your review is the 7.5' USGS topographic map of the San Fernando quadrangle depicting the boundaries of the project area, specifically identifying the location of the spreading grounds and the location of where the radial gate will be replaced with a rubber dam.

We are also requesting a list of groups or representatives to contact regarding the proposed project.

Thank you for honoring this request. For correspondence, please use our project number 20600. If you have any questions regarding this request, please contact me at (949) 261-5414 xt. 7233, or our Cultural Resources Director, Dr. Wayne Bischoff at (949) 261-5414 xt. 7261.

Sincerely,

Clarence Bodmer

CHAMBERS GROUP

October 31, 2013

Beverly Salazar Folkes
1831 Shadybrook Drive
Thousand Oaks, CA 91363

SUBJECT: **CHAMBERS GROUP INC. PROJECT NUMBER #20600: PACOIMA SPREADING GROUNDS IMPROVEMENT PROJECT, CITY OF LOS ANGELES, LOS ANGELES COUNTY, CALIFORNIA**

Dear Ms. Folkes,

Chambers Group, Inc. has been retained by the County of Los Angeles Department of Public Works (LADPW) to provide a cultural resources study for the Pacoima Spreading Grounds Project located near the intersection of Paxton and Arleta Streets, on the west side of the Pacoima Diversion Channel, in the City of Los Angeles. The facility is one of the major water conservation facilities that recharge the San Fernando Basin, consisting of 12 large shallow basins with a storage capacity of 530 acre-feet (AF). The proposed project will increase the storage capacity and simplify operations by combining basins and constructing new interbasin structures. The project will also optimize the recharge capacity of the spreading grounds by modernizing and automating the existing intake structures while improving the spreading basins to increase retention capacity.

The project area lies within an un-sectioned portion of the Rancho Ex-Mission San Fernando Mexican land grant on the San Fernando USGS 7.5' quadrangle. The project area falls within the existing boundaries of the Spreading Grounds basin. An accompanying topographic map (1:24,000 scale) shows the exact location of the project area.

The California Environmental Quality Act (CEQA) calls for background research and an inventory of properties to evaluate if cultural resources will be impacted by the proposed undertaking. A record search of the NAHC Sacred Lands File prior to this letter failed to indicate the presence of any cultural resources. At this time, we request your assistance in identifying any cultural sites or areas of cultural significance that could be affected by the proposed project. If there are sensitive resources in or near the proposed project location that could be impacted by construction activities, or if you have any questions or concerns regarding the proposed project, please feel free to contact me directly.

For correspondence, please use our project number 20600. If you have any questions regarding this request, please contact me at (949) 261-5414 ext. 7507.

Sincerely,

CHAMBERS GROUP, INC.

LA City/County Native American Indian Commission
Ron Andrade, Director
3175 West 6th Street, Rm. 403
Los Angeles, CA 90020

SUBJECT: **CHAMBERS GROUP INC. PROJECT NUMBER #20600: PACOIMA SPREADING GROUNDS IMPROVEMENT PROJECT, CITY OF LOS ANGELES, LOS ANGELES COUNTY, CALIFORNIA**

Dear Director Andrade,

Chambers Group, Inc. has been retained by the County of Los Angeles Department of Public Works (LADPW) to provide a cultural resources study for the Pacoima Spreading Grounds Project located near the intersection of Paxton and Arleta Streets, on the west side of the Pacoima Diversion Channel, in the City of Los Angeles. The facility is one of the major water conservation facilities that recharge the San Fernando Basin, consisting of 12 large shallow basins with a storage capacity of 530 acre-feet (AF). The proposed project will increase the storage capacity and simplify operations by combining basins and constructing new interbasin structures. The project will also optimize the recharge capacity of the spreading grounds by modernizing and automating the existing intake structures while improving the spreading basins to increase retention capacity.

The project area lies within an un-sectioned portion of the Rancho Ex-Mission San Fernando Mexican land grant on the San Fernando USGS 7.5' quadrangle. The project area falls within the existing boundaries of the Spreading Grounds basin. An accompanying topographic map (1:24,000 scale) shows the exact location of the project area.

The California Environmental Quality Act (CEQA) calls for background research and an inventory of properties to evaluate if cultural resources will be impacted by the proposed undertaking. A record search of the NAHC Sacred Lands File prior to this letter failed to indicate the presence of any cultural resources. At this time, we request your assistance in identifying any cultural sites or areas of cultural significance that could be affected by the proposed project. If there are sensitive resources in or near the proposed project location that could be impacted by construction activities, or if you have any questions or concerns regarding the proposed project, please feel free to contact me directly.

For correspondence, please use our project number 20600. If you have any questions regarding this request, please contact me at (949) 261-5414 ext. 7507.

Sincerely,

Wayne Bischoff

Project Number: 3DPW027200

Key Words: Pacoima Spread Grounds, Quaternary Gravel, Quaternary Alluvium

MANAGEMENT SUMMARY

PURPOSE AND SCOPE

BonTerra Psomas undertook this project as part of California Environmental Quality Act (CEQA) requirements for the Pacoima Spreading Grounds Improvement Project. This Phase I Paleontological Resources Study was designed to identify, evaluate, and develop appropriate mitigation measures for any significant paleontological resources present on the project site.

DATES OF INVESTIGATION

On April 27, 2015, a paleontological resources survey was conducted by Paleontologist Mark Roeder with the assistance of John Bodenchak of the Los Angeles County Department of Public Works. This report was completed in May 2015.

FINDINGS OF THE INVESTIGATION

No paleontological resources were observed; however deeper excavations during the removal of clay beds may expose paleontological resources.

INVESTIGATION CONSTRAINTS

The study area was heavily disturbed by previous construction activities. These activities included construction of dikes, basins, and diversion structures. Also, the sediments in the basins have been previously excavated and/or disturbed by maintenance activities. Access to this area was primarily via the road on the dikes. The basins were dry and covered with vegetation.

MITIGATION

Paleontological monitoring of grading. Implementation will reduce project impacts to a less than significant level.

DISPOSITION OF DATA

This report will be filed with the client and with BonTerra Psomas. All field notes and other documentation related to the study are on file at the BonTerra Psomas Santa Ana office.

1.0 UNDERTAKING INFORMATION/INTRODUCTION

1.1 CONTRACTING DATA

The Los Angeles County Flood Control District (LACFCD) retained BonTerra Psomas to conduct a Phase I Paleontological Resources Study for the proposed Pacoima Spreading Grounds Improvement Project ("project"). This report details the findings of the investigation and offers management recommendations and mitigation measures to reduce the impact of the project to a less than significant level.

1.2 UNDERTAKING

At various times since the 1930's, the spreading basins have been excavated into native alluvial material. The levees that separate the individual basins consists of artificial fill and are typically about 15 feet high. Recent drilling operations indicate the presence of subsurface clay-rich horizons between 3 to 10 feet in thickness that underlie most of the spreading basins (LACDPW 2007, 2009) down to a maximum depth of 19 feet. These clay layers disrupt the downward infiltration of waters. Removal of these clays and replacement with coarser material will greatly improve the percolation rate. Also, these excavations will increase basin capacity and water conservation. To remove the clay horizons, 1.6 million cubic yards of sediment will be excavated with 1.37 million yards being exported.

1.3 EXHIBITS

Exhibit 1 depicts the general location of the project site. Exhibit 2 depicts the specific location of the project site on a portion of the U.S. Geological Survey's (USGS') San Fernando 7.5-minute quadrangles, in Township 2 North, Range 115 West, unsurveyed section. Exhibit 3 is the geologic map that provides details the geologic units present within the project site.

1.4 PROJECT PERSONNEL

BonTerra Psomas Paleontologist Mark A. Roeder reviewed the paleontological literature and records searches, completed a field survey, and prepared the technical report. Refer to Attachment A for qualifications.

2.0 REGULATORY SETTING

This section contains a discussion of the applicable laws, ordinances, regulations, and standards that govern cultural resources and must be adhered to both prior to and during project implementation. The report is intended to satisfy the requirements of the California Environmental Quality Act (CEQA) regulations (*California Public Resources Code* [PRC] §21083.2) and the State CEQA Guidelines (14 *California Code of Regulations* [CCR] §15064.5).

CEQA requires a lead agency to determine whether a project would have a significant effect on paleontological resources.

The proposed project will comply with all applicable governmental regulations, as discussed below. The analysis in this report takes into account that compliance with the applicable regulations will be required, and thus, is essentially a part of the proposed project. Standard compliance with existing regulations pertinent to the proposed project cannot be considered mitigation for significant impacts under CEQA, but may be identified in the impact analysis below as regulatory requirements.

2.1 STATE

This section discusses State regulations applicable to paleontological resources on the project site.

2.1.1 California Environmental Quality Act and Guidelines

CEQA (as codified in §§21000 et seq. of the PRC) and the State CEQA Guidelines (as codified in 14 CCR §§15000 et seq.) establish a process by which various resources, including cultural and paleontological resources, may be assessed and considered for the purposes of proposed projects under State oversight. The nature of the resources themselves and the potential impacts to those resources are evaluated as part of the CEQA compliance review process.

The *California Code of Regulations* states that No person shall destroy, disturb, mutilate, or remove earth, sand, gravel, oil, minerals, rocks, paleontological features or features of caves" (14 CCR 4307). The code also states that "No person shall remove, injure, disfigure, deface, or destroy any object of archaeological or historical interest or value" (14 CCR 4308).

2.1.2 Native American Historic Resource Protection Act

The Native American Historic Resource Protection Act (*California Public Resources Code* §§5097–5097.9993) protects cultural resources on California Public lands and was amended by Senate Bill 1034 in 2010. It states that a person shall not knowingly and willfully excavate upon, or remove, destroy, injure, or deface, a vertebrate paleontological site or any paleontological feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.

2.1.3 California Penal Code

Section 6221.2 of the *California Penal Code* states that "every person, not the owner thereof, who willfully injures, disfigures, defaces, or destroys any object or thing of archeological or historical interest or value, whether situated on private lands or within any public park or place, is guilty of a misdemeanor".

2.2 REGIONAL AND LOCAL

2.2.1 County of Los Angeles General Plan Conservation and Open Space Element (1980)

The County of Los Angeles General Plan's Conservation and Open Space Element, Cultural Heritage Resources (County of Los Angeles 1980:II-5–II-6) states t the following:

> The County also has paleontological sites and important geological formations from periods many million years before the appearance of man. Our cultural heritage is nonrenewable and irreplaceable.
>
> Problem: Resources continue to be haphazardly protected, and often there are insufficient funds for saving a threatened site or structure. . .
>
> Objective: Programs and procedures to identify and protect our cultural resources are needed. Public awareness of their value should be encouraged, and their public enjoyment should be fostered whenever possible.

2.2.2 County of Los Angeles General Plan Conservation and Natural Resources Element (2014 Draft)

This element guides the long-term conservation of cultural and paleontological resources and states the following:

- Paleontological resources are non-renewable and irreplaceable
- The primary threats to paleontological resources are incompatible land uses and development on or adjacent to resources, a lack of local registry, and the limitations of State and federal programs to protect resources.

The following policies relate to the protection of paleontological resources.

- Policy C/NR 14.1: Mitigate all impacts from new development on or adjacent to paleontological resources to the greatest extent feasible.
- Policy C/NR 14.2: Support an inter-jurisdictional collaborative system that protects and enhances paleontological resources.
- Policy C/NR 14.5: Promote public awareness of paleontological resources.
- Policy C/NR 14.6: Ensure proper notification and recovery processes are carried out for development on or near paleontological resources.

3.0 NATURAL SETTING

The project is located in the northeastern portion of the San Fernando Valley (Exhibit 1) within the Pacoima Wash Drainage. The project area is depicted on the USGS San Fernando 7.5-minute quadrangle map (1966; photorevised 1988) within Township 2 North, Range 17 West, unsurveyed section (Exhibit 2).

4.0 METHODS

4.1 LITERATURE REVIEW

The literature review for this study included an examination of the geologic maps for the Project area. The literature review encompasses the entire project footprint and included a one-mile buffer around it (hereinafter referred to as the “Study Area”). The review included previous geologic mapping of the area. In addition to the reviewed published geologic maps, technical reports provided the basis from which the regional and project-specific geology was derived for this project.

Pertinent published literature and unpublished manuscripts with regards to the geology and paleontology of northern Los Angeles City and the San Fernando Valley were also reviewed for this project. In the process of conducting the background literature review, existing paleontological resource data (including such published resources as books, journals, and geologic maps, as well as information available via the internet on government websites) were consulted. Furthermore, an online database search was conducted to identify previous paleontological resource assessments conducted within the boundaries of the project site and in the surrounding areas.

4.2 PALEONTOLOGICAL RESOURCES RECORDS SEARCH

A paleontological records search from the Vertebrate Paleontology Section of the Natural History Museum of Los Angeles was requested and received and can be found in Attachment B (McLeod

2015). Also the Catalog of Late Pleistocene vertebrates from California (Jefferson 2008) was reviewed for the project area.

4.3 PALEONTOLOGICAL RESOURCES SURVEY

BonTerra Psomas Paleontologist Mark A. Roeder conducted a paleontological resource survey to identify any unrecorded paleontological resources and to physically evaluate the mapped geologic data as presented in the record searches and literature review. Moreover, the survey was intended to physically examine the surficial rock units within the project site and to determine their paleontological sensitivity ratings. Mr. Roeder conducted a paleontological resources field survey on April 27, 2015. The survey involved a windshield survey and some physical inspections of surface geologic exposures for the presence of paleontological resources and/or the potential to yield paleontological resources.

5.0 RESULTS

5.1 LITERATURE REVIEW, RECORD SEARCHES, FIELD SURVEY

5.1.1 Literature Review

Regional Geology

The San Fernando Valley and adjacent mountains are part of the Transverse Ranges physiographic province that is composed of parallel, east-west trending mountain ranges and sediment-filled valleys.

The Pacoima Spreading Grounds are located at the northeastern end of the San Fernando Valley, which is an elongated valley, roughly 22 miles long (in an east/west direction) and generally 9 miles wide (in a north/south direction), although stretching to 12 miles wide at its widest point. Situated within the Transverse Ranges geomorphic province of California, the San Fernando Valley is bound by the San Gabriel and Santa Susana Mountains to the north, the Santa Monica Mountains to the south, the Verdugo Mountains to the east, and the Simi Hills to the west. The San Fernando Valley contains thick deposits of alluvium from the surrounding mountains.

Project Geology

The geology of the Project area can be seen in Exhibit 3. The area is underlain by three surficial sedimentary rock units: artificial fill (af), Quaternary gravel, and Quaternary alluvium (Oakeshott 1958; Jennings and Strand 1969; Dibblee 1991; LACDPW 2007, 2009).

Artificial Fill (af)

Most of the artificial fill is in the levees between and adjacent to the basins and the surface and subsurface of the basins. Sand, silt, gravel, and clay were excavated from the basins to construct the levees that vary in height from 8 to 16 feet from the basin bottoms (LACDPW 2007). Because this material is highly disturbed and of recent age, the likelihood of paleontological resources is extremely low.

Quaternary Gravel (Qg)

Most of the Study Area is underlain by Quaternary gravel (Qg) (Dibblee 1991; Exhibit 3), which consists of sand, silt, clay, and gravel deposited in the Pacoima Wash Drainage as either stream channel and/or floodplain (overbank) deposits. In various areas, the upper horizons of these sediments are disturbed from surface to possibly a depth of 10 feet from past excavations to

construct the spreading grounds and berms. Although very young in surface and at shallow depths, these sediments increase in age at deeper levels. In similar Late Pleistocene-aged sediments, remains of large extinct mammals such as Columbian mammoth, mastodon, ground sloth, tapir, horse, camel, dire wolf, saber-tooth cat, and American lion were recovered (Jefferson 2008; Miller 1971) as well as remains of extant smaller fish, amphibians, reptiles, birds, and mammals. .

McLeod (2015) stated "these deposits typically do not contain significant vertebrate fossil remains, at least in the uppermost layers. At depth, however, older Quaternary sediments that contain significant fossil vertebrate materials are likely to be encountered.

Quaternary Alluvium (Qa)

Along the Study Area's northern and southern boundaries, a narrow outcrop belt is present that is underlain by Quaternary alluvium (Qa), which consists of sand, silt, and clay deposited in the Pacoima Wash Drainage as either stream channel and/or floodplain (overbank) deposits and may be equivalent or older than the Quaternary gravel (Qg) (Dibblee 1991; Exhibit 3). Although very young in surface and at shallow depth, these sediments increase in age at deeper levels. In similar Late Pleistocene-aged sediments, remains of large extinct mammals such as Columbian mammoth, mastodon, ground sloth, tapir, horse, camel, dire wolf, saber-tooth cat, and American lion were recovered (Jefferson 2008; Miller 1971). Also, the remains of extant smaller fish, amphibians, reptiles, birds, and mammals have been recovered (Jefferson 2008; Miller 1971).

McLeod (2015) stated "these deposits typically do not contain significant vertebrate fossil remains, at least in the uppermost layers. At depth, however, older Quaternary sediments that contain significant fossil vertebrate materials are likely to be encountered.

Paleontological Record Searches

Although the records search from the Vertebrate Paleontology Section of the Natural History Museum showed no vertebrate (animals with backbones, fish, amphibians, reptiles, birds and mammals) sites in the Study Area (McLeod 2015), he mentions a number of significant fossil finds in the vicinity (less than 10 miles away).

Paleontological Field Survey

On April 27, 2015, Mr. Roeder conducted the paleontological resources field survey. In the company of John Bodenchak (LACDPW), he conducted a windshield survey and minor physical inspections. No underlying bedrock formations were exposed for visual inspection. No paleontological resources were observed.

6.0 CEQA IMPACT ANALYSIS

This impact analysis is provided to assist in the preparation of an environmental document for the proposed project and provides discussion regarding the significance criterion for paleontological resources.

6.1 SIGNIFICANCE CRITERIA

Appendix G of the State CEQA Guidelines contains the Initial Study Environmental Checklist Form, which includes one question relating to paleontological resources. The issue presented in the Initial Study Checklist has been used as a significance criterion. Accordingly, a project may result in a significant environmental impact if it:

- Would directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

6.2 PROJECT IMPACT ANALYSIS

Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Within the Survey Area are exposures of surficial sediments that are very young and, because of their youthfulness, typically do not contain fossil resources. However, these sediments become older with increasing depth and may yield paleontological resources.

Geological and paleontological information on rock formations based on paleontological resources within and adjacent to the project site were used to rate the paleontological sensitivity of the units and their potential for containing and yielding fossils; this information is presented in Table 1.

TABLE 1
PALEONTOLOGICAL SENSITIVITY

Rock Unit	Description	Sensitivity
Artificial Fill (af)	Artificial fill consists of sand, silt, gravel, and clay that apparently was excavated from the basin areas to construct the dikes.	No
Quaternary Gravel (Qg)	Quaternary gravel consists of gravel and sand deposited in the channel of Pacoima Wash and its floodplain environments.	*Low
Quaternary Alluvium (Qa)	Quaternary alluvium consists of gravel, sand, silt, and clay deposited in steam cannels and/or floodplain environments.	*Low
*Moderate sensitivity in excavations more than 10 feet below the current ground surface Sources: Oakeshott 1958;Jennings and Strand 1969; Dibblee 1991; County of Los Angeles Dept. of Public Works 2007,2009		

On the project site, large areas are slated for excavation within the Quaternary gravel and Quaternary alluvium. The surface area and alluvial sediments beneath the current spreading grounds have been impacted by past construction/maintenance activities associated with berm and spreading ground excavations. Because of its moderate paleontological sensitivity of possibly undisturbed native sediments at depths greater than ten feet, direct impacts to paleontological resources may result from excavation for removal of clay horizons and a diversion channel and from basin reconfiguration. Such excavations in sensitive sediments at a depth of

ten feet or more must be monitored by County on-site staff and construction personnel, trained by a qualified Paleontologist, as described in the mitigation measure below.

7.0 MITIGATION MEASURE

Prior to the start of sediment removal, a qualified Paleontologist shall be present at the pre-grading conference to establish procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of newly discovered paleontological resources found during excavation activities. The paleontologist shall conduct a training for construction personnel and County on-site staff on the identification of possible paleontological resources that may be present in the area. A monitoring protocol shall be established to identify and salvage any paleontological resources that may be unearthed through excavation activities. Monitoring would only be required for soil disturbance into native soils that have the potential for resources, which occur approximately 10 feet or deeper below the surface soils. The County Monitors must be adequately trained by a qualified Paleontologist in the recognition of paleontological resources. Any discovered resources shall be reported to a qualified Paleontologist for evaluation. If the resource is found to be significant, the Paleontologist shall determine appropriate actions, in cooperation with the County, for further exploration and/or salvage. A Disposition of the Recovered Paleontological Resources and Mitigation Report shall be prepared by the qualified Paleontologist and submitted to the County. Any recovered fossils shall be deposited in an accredited institution or museum, such as the Natural History Museum of Los Angeles County.

8.0 CERTIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this paleontological resources report, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

Attn: Mark A. Roeder

re: Paleontological resources for the proposed Pacoima Spreading Grounds Improvement Project, Psomas Job # 3DPW027200, in the City of Los Angeles, Los Angeles County, project area

Dear Mark:

I have conducted a thorough search of our paleontology collection records for the locality and specimen data for paleontological resources for the proposed Pacoima Spreading Grounds Improvement Project, Psomas Job # 3DPW027200, in the City of Los Angeles, Los Angeles County, project area as outlined on the portion of the San Fernando USGS topographic quadrangle map that you sent to me via e-mail on 1 May 2015. We do not have any vertebrate fossil localities that lie directly within the proposed project boundaries, but we do have localities nearby from the same sedimentary deposits that occur at depth in the proposed project area.

In the entire proposed project area the surface deposits consist of gravelly younger Quaternary Alluvium, derived as fluvial deposits from the Pacoima Wash. These deposits typically do not contain significant vertebrate fossil remains, at least in the uppermost layers. At depth, however, older Quaternary sediments that contain significant fossil vertebrate materials are likely to be encountered. Our closest fossil vertebrate localities from similar deposits are just west of north of the proposed project area at or near the Van Norman Reservoir. These localities include LACM 3397 that produced fossil bison, *Bison*, at a seventy-five foot depth, LACM 5745 that contained fossil mastodon, *Mammut*, and horse, *Equus*, in fill dirt and LACM 7152 that produced fossil mammoth, *Mammuthus*, and bison, *Bison*, in terrace deposits.

Our next closest fossil vertebrate locality from similar deposits is LACM 1146, east-southeast of the proposed project area northeast of the Golden State Freeway (I-5) and east of San Fernando Road, that produced fossil specimens of mastodon, *Mammut*, horse, *Equus*, and camel, Camelidae, from a gravel pit at depths of 160-170 feet below the surface.

Shallow excavations in the younger Quaternary Alluvium exposed throughout the proposed project area are unlikely to produce significant fossil vertebrate remains. Deeper excavations in the proposed project area that extend down into older Quaternary deposits, however, may well encounter significant vertebrate fossils. Any substantial excavations in the proposed project area, therefore, should be monitored closely to quickly and professionally recover any fossil remains discovered while not impeding development. Sediment samples should also be collected and processed to determine the small fossil potential in the proposed project area. Any fossils recovered during mitigation should be deposited in an accredited and permanent scientific institution for the benefit of current and future generations.

This records search covers only the vertebrate paleontology records of the Natural History Museum of Los Angeles County. It is not intended to be a thorough paleontological survey of the proposed project area covering other institutional records, a literature survey, or any potential on-site survey.

Sincerely,

Samuel A. McLeod

Mark A. Roeder

Senior Paleontologist

EDUCATION

1977 / Bachelor of Arts, Anthropology / San Diego State University, CA

PROFESSIONAL REGISTRATION

Registered Paleontologic Consultant, County of Orange

Mark A. Roeder has 34 years of experience as a Paleontologist. He has extensive experience with California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) compliance and with conducting and managing paleontological resource impact assessments and impact mitigation programs for large construction projects in California. Project experience includes municipal solid waste landfills; aggregate quarries; flood-control facilities; oil refineries; natural gas pipelines; freeways and other roadways; subways; waste water treatment facilities; housing developments; planned communities; office buildings/complexes; shopping centers; hospitals and medical centers; industrial complexes; parking lots/structures; land exchanges; and conditional use permit and specific plan revisions. He has worked for a diverse set of clients including private-industry clients; public utilities; conservancies; and federal, State, County, City, and regional agencies. Mr. Roeder has conducted paleontological resource assessments—which involve data searches such as literature reviews, archival searches, field surveys, and consultation with other paleontologists—in order to develop baseline inventories to evaluate the scientific importance of resources and potential for disturbance by adverse, project-related impacts; and to formulate mitigation measures to reduce these impacts to less than significant levels. Mr. Roeder has worked on paleontological resources impact mitigation programs that have required monitoring of earth-moving activities, recovery of fossil remains, field personnel supervision, and progress and final report preparation. His previous project participation has involved extensive coordination and consultation with project proponents, other consulting firms, and permitting agencies; adherence to strict delivery schedules; and completion of tasks within specified budget limits. Mr. Roeder also has an extensive paleontological research background in the fish faunas of the Cenozoic marine and lacustrine formations of Southern California.

Representative Project Experience

Simi Valley Landfill Paleontological Monitoring, Simi Valley: Mr. Roeder was the Field Paleontologist for the Simi Valley Landfill and conducted paleontological resource monitoring during excavations for cover stockpiles and cell development. He supervised the collections of fossils during these excavations. Mr. Roeder worked closely with the paleontologists of the Natural History Museum of Los Angeles County during the treatment, identification, and curations of these fossils into the Museum collections.

Desert Harvest Solar Project, Desert Center: Mr. Roeder was the Field Paleontologist for the Simi Valley Landfill and supervised paleontological resource monitoring during excavations for cover stockpiles and cell development. He was responsible for supervising and participating in fossil salvages, recordation of pertinent paleontological and geological data, preparation and stabilization of fossil finds, and the final paleontological resource mitigation report.

Silverleaf Solar Project, El Centro: Mr. Roeder was the Paleontologist for this project and was responsible for a paleontological resource management document for proposed solar energy generation area and transmission line. He conducted paleontological resource survey of approximately 1,500 acres for the proposed solar farm facility and associated transmission line and power line tie-ins. The

report included e results of record and literature searches, methods, results and mitigation.

Prima Deshecha Landfill Paleontological Monitoring, San Clemente: Mr. Roeder was the Field Paleontologist was responsible for coordination of paleontological resource monitoring, supervising and participating in fossil salvages, recordation of pertinent paleontological and geological data, preparation and stabilization of fossil finds, and the final paleontological resource mitigation report.

Sunset Ridge Park Paleontological Assessment, Newport Beach: Mr. Roeder is the Paleontologist for the Sunset Ridge Park project. Located on the northwestern corner of Superior Avenue and West Coast Highway, the approximate 18.9-acre site, located within the Coastal Zone, would be developed with active and passive recreational uses. Mr. Roeder wrote the paleontological assessment in order to determine the project site's potential for the presence of sensitive rock formations and fossil resources. The paleontological significance of the project site was deemed "high". In January 2014, Mr. Roeder supervised paleontological work which included an intensive site survey, sampling of fossil outcrops, preservation of some outcrops (if possible), and monitoring of construction activities for the park. The treatment of the fossils and documentation report are pending.

Newport Banning Ranch Paleontological Assessment, Newport Beach: Mr. Roeder was a Paleontologist for this project. The Newport Banning Ranch project would allow for the development of up to 1,375 residential dwelling units; 75,000 square feet of commercial uses; a 75-room resort inn; and approximately 52 acres of public parks on a 401-acre site. Mr. Roeder wrote the paleontological assessment in order to determine the project site's potential for the presence of sensitive rock formations and fossil resources. The paleontological significance of the project site was deemed "high. Mr. Roeder will be involved with future paleontological work including an intensive site survey, sampling of fossil outcrops, preservation of some outcrops (if possible), and monitoring of construction activities.

Eastern Transportation Corridor (State Route 241) Project, Orange County: Mr. Roeder was the Senior Paleontologist for the Eastern Transportation Corridor Project. He supervised the paleontologist resource monitoring and collection of fossil samples during construction activities. Also, he was involved in the treatment and documentation of the fossils.

Sandalwood Drive Extension Paleontological Monitoring and Mitigation, Calimesa: Mr. Roeder was a Paleontologist for the Sandalwood Drive Extension project, which involved the grading of a one-mile-long access road. He directed paleontological monitoring of the project site. Twenty-four paleontological sites were discovered that yielded over 500 fossil specimens. Mr. Roeder provided paleontological resources mitigation services during earth-moving activities, and treated fossils found on the project site. Treatment included cleaning, identifying and stabilizing fossils for curation, and documentation.

San Diego 6 Pipeline Project Paleontological Monitoring, Temecula: Mr. Roeder was a Paleontologist for the San Diego 6 Pipeline Project for the Metropolitan Water District of Southern California and he directed paleontological monitoring of trenching activities. Three paleontological sites were discovered that yielded over 100 fossil specimens. Mr. Roeder provided paleontological resources mitigation services during earth-moving activities and treated fossils uncovered on the project site. Treatment included cleaning, identifying and stabilizing the fossils for curation and documentation.

EXECUTIVE SUMMARY

This Executive Summary presents the results of the Phase I Environmental Site Assessment (ESA) performed by Geosyntec Consultants (Geosyntec) for the Pacoima Spreading Grounds (the Site) located in the northern San Fernando Valley in the Los Angeles Basin, California. The Site is located near the intersection of Devonshire Street and Arleta Avenue on the west side of the Pacoima Diversion Channel (Figure 1) in Los Angeles, California. The Site encompasses approximately 169 acres including a radial gate to an intake canal (from the Pacoima Diversion Channel), equipment control/ storage structures, and 12 spreading basins (Figure 2). The area surrounding the Site includes residences, parks, drainage channels and freeways. This Phase I ESA was prepared in accordance with the scope of work, terms and conditions described in Geosyntec's proposal dated 16 December 2014. This Phase I ESA was prepared to support the California Environmental Quality Act (CEQA) process for a basin enhancement project at the Site consisting of removal of clay layers of soil beneath the basins to enhance the infiltration capacity of the system and replacement of the intake canal.

The objective of performing this Phase I ESA in accordance with ASTM Standard E 1527-13 was to identify, to the extent feasible, "Recognized Environmental Conditions" (RECs) at the Site as the "REC" term is defined by ASTM E 1527-13[1].

FINDINGS AND CONCLUSIONS

The Site receives drainage from the Pacoima Wash subwatershed. The Site facilitates the groundwater basin recharge by receiving the Pacoima Wash surface water, removing sediment and debris, and spreading the water through the basins allowing for percolation into the underlying groundwater. The Site has been serving as a drainage/flood control feature, and later a spreading grounds, since the early 1900s.

Land use surrounding the Site has evolved from rural and undeveloped into densely developed urban uses. The Site vicinity is currently mostly developed as residential and there are two parks adjoining the Site to the east and west, a plant nursery to the east and some commercial use to the south.

The Phase I ESA revealed evidence of recognized environmental conditions (RECs) in connection with the Site. The Site comprises spreading grounds; a drainage and flood control feature that receives surface water and debris from a large subwatershed area

[1] ASTM E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.

within the San Gabriel Mountains and the San Fernando Valley urban areas. The results of this assessment indicate that potential sources of environmental impact at the Site include:

- The closed San Fernando City Landfill and the oil and gas wells located adjacent to the Site (northeast of the Site) are potential sources of gas migration to the Site;

- underground storage tanks that were located on-Site at 10450 Arleta Avenue (northeast portion of the Site); and

- petroleum hydrocarbons and lead that were detected in soil samples during previous subsurface investigations on the northeast portion of the Site.

1. INTRODUCTION

1.1 Terms of Reference

This report documents the results of the Phase I Environmental Site Assessment (ESA) performed by Geosyntec Consultants, Inc. (Geosyntec) for the Pacoima Spreading Grounds (the Site) located in the northern portion of the San Fernando Valley near the intersection of Devonshire Street and Arleta Avenue on the west side of the Pacoima Diversion Channel (Figure 1). The boundaries of the Site encompassing approximately 169 acres are included in Figure 2. This Phase I ESA was prepared in accordance with the scope of work, terms and conditions described in Geosyntec's proposal dated 16 December 2014. This report incorporates, by reference, the American Society of Testing and Materials (ASTM) Standard E 1527-13, "*Standard Practice for Environmental Assessments: Phase I Environmental Site Assessment Process*." Limitations and exceptions are provided in Section 1.4 of this report.

1.1 Purpose

The Los Angeles County Flood Control District (LACFCD) is planning a basin enhancement project (Project) at the Site and is subject to the California Environmental Quality Act (CEQA) process. This Phase I ESA was performed to primarily support the CEQA process.

The overall objective of the Project is to expand and reconfigure the spreading basins to increase the spreading grounds' storage capacity, percolation rate, and annual water conservation. The following have been proposed by the LACFCD:

- reconfiguring the spreading basins: combining and deepening the existing basins;
- removing the low permeability clay layers underlying the spreading basins and replacing them with higher permeability soils;
- exporting excavated materials; and
- replacing the intake canal with buried pipes.

Considering the scope of the Project, additional Site-specific considerations were incorporated into the scope of this Phase I ESA, including:

- hydrogeologic conditions (such as groundwater flow regime and groundwater quality);

- hydrologic conditions (such as surface water flow regime and surface water quality from the upgradient tributary drainage, including industrial discharges, beyond the Site limits); and

- the known occurrence and potential for natural or industrial fires that may result in additional concentrations of fire or fire-related cleanup debris and constituents (such as metals) at the Site.

The purpose of the Phase I ESA was to identify Recognized Environmental Conditions (RECs), Historical Recognized Environmental Conditions (HRECs), and/or Controlled Recognized Environmental Conditions (CRECs) at the Site. For the purpose of this report, and as defined by ASTM Standard E1527-13, a REC is, "… *the presence or likely presence of any hazardous substance or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.*"

A HREC is "… *a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).*"

A CREC is a REC "… *resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).*"

This Phase I ESA report is intended to satisfy certain requirements for the conduct of "all appropriate inquiries" (AAI) as established by the United States Environmental Protection Agency (USEPA) in 2006.

1.2 Scope of Services

Geosyntec was authorized on 6 January 2015 by BonTerra Psomas (on behalf of LACFCD), to complete a Phase I ESA of the Site. The scope of services included:

- searching standard local, state, and federal environmental record sources within recommended ASTM search distances;
- reviewing available physiographic information including topographic, geologic, hydrologic, and hydrogeologic information;
- reviewing available records on known natural or industrial fires potentially posing a REC/CREC/HREC;
- reviewing historical aerial photographs;
- reviewing historical fire insurance maps;
- performing a Site reconnaissance;
- conducting an interview with the Site owner; and
- documenting the procedures, findings, opinions, and conclusions of the Phase I ESA in this report.

This work was completed in general accordance with ASTM Practice E 1527-13 with the limitations and exceptions described in Section 1.4 of this report. For the purposes of this Phase I ESA report, BonTerra Psomas and LACFCD are the "users," defined as "the party seeking to use Practice E 1527-13 to complete an *environmental site assessment* of the *property*…"

1.3 Limitations and Exceptions

This Phase I ESA is intended to reduce, but not eliminate, uncertainty regarding the potential for RECs, HRECs, and/or CRECs in connection with the Site. Not every property warrants the same level of assessment. Consistent with good commercial or customary practice, the appropriate level of assessment was guided by the type of property subject to assessment, the requirements of ASTM E 1527-13 pertaining to the satisfaction of EPA's All Appropriate Inquiry requirements, and the information developed in the course of the inquiry. A balance between the competing goals of limiting cost and time demands and the reduction of uncertainty about unknown conditions resulting from additional information was identified during the Phase I ESA.

Additional services considered optional by ASTM E 1527-13, such as asbestos-containing building materials, radon, lead-based paint, lead in drinking water, wetlands, regulatory compliance, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, biological agents, mold, and high voltage power lines, were not included in the scope of work (Table 2).

The findings and conclusions presented in this Phase I ESA report are the result of professional interpretation of the information collected at the time of this study. This Phase I ESA was not an exhaustive search of all available records, nor does it include

detailed assessment of all Phase I ESA findings. Geosyntec cannot "certify" or guarantee that any property is free of environmental impairment; no warranties regarding the environmental quality of the property are expressed or implied.

This Phase I ESA did not include the sampling of rock, soil, groundwater, surface water, soil vapor, air, or on-Site substances or materials. Therefore, it is not possible to confirm the presence or absence of hazardous substances or petroleum products in the environments associated with the Site.

The findings of this report, to the best of our knowledge, are valid as of the date of this work. However, changes in the conditions of a property can occur with the passage of time, whether due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate regulations and standards may occur, whether they result from legislation, from the broadening of knowledge, or for other reasons. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control.

Specified information contained in this report has been obtained from publicly available sources and other sources of information. Although care has been taken in compiling this information, Geosyntec disclaims any and all liability for any errors, omissions, or inaccuracies in such information and data.

The work was performed using the degree of care and skill ordinarily exercised under similar circumstances by environmental consultants practicing in this or similar localities. No other warranty or guarantee, expressed or implied, is made as to the findings, opinions, conclusions, and recommendations included in this report.

2. SITE AND VICINITY DESCRIPTION

2.1 Site Location and Description

The Site is located in the northern portion of the San Fernando Valley near the intersection of Devonshire Street and Arleta Avenue on the west side of the Pacoima Diversion Channel (Figure 1). The facility is bordered by Filmore Street to the southeast, Woodman Avenue to the west, San Jose Street to the north, and Arleta Avenue to the northeast and is approximately bisected by Devonshire Street. The Site includes an intake gate and canal that allow the flow of water into the 12 spreading basins where the water percolates into the groundwater (Figure 2). Equipment are stored and controlled in the structures located on northeast portion of the Site referred to as the headworks.

The Pacoima Spreading Grounds facility is one of the major water conservation facilities that recharge the San Fernando Groundwater Basin. The facility conserves water that is supplied by imported water, storm flows, and controlled releases from Pacoima Dam, partially controlled flow from Lopez Basin, and uncontrolled flows from East Canyon and Pacoima Wash [LACFCD, 2014].

2.2 Geoenvironmental Characteristics

2.2.1 Topography

The Site is located within the United States Geological Survey (USGS) San Fernando Quadrangle map.[2] The elevation of the Site varies from approximately 960 feet (ft) on the northeast portion to 910 ft above mean sea level (amsl) on the southwest portion [USGS 1995] where the average elevation of the Site is approximately 935 ft amsl. The general topographic gradient for the area is sloping towards the south-southwest [EDR, 2015].

2.2.2 Geology

The Site is located in northern San Fernando Valley, which is an east-west trending basin within the Transverse Ranges Geomorphic Province of Southern California. The geological structure of the Transverse Ranges is dominated by the effects of compressive deformation resulting in thrust faulting, strike-slip faulting, and bedrock

[2] Available for electronic download from *store.usgs.gov*. Additional information was obtained from an Environmental Data Resources Inc. (EDR) Historical Topographic Maps (Appendix A).

folding. The valley is bounded by the Verdugo, Santa Susana, and San Gabriel Mountains to the north and the Santa Monica Mountains to the south [LACDPW 2009].

The Site is located in the portion of the basin consisting of the sediments deposited by Pacoima Wash and Tujunga Wash. The sediments include sand, silt, gravel and clays that have formed during the weathering process [LACDPW, 2007].

Alluvium predominantly containing sand, silt and gravel was observed during previous subsurface investigations at the Site. The results of these investigations also identified a clay layer that appeared to dip south-southwest. The thickness of this clay layer was reported to vary from 3 to 10 ft. The depth to the top of the clay layer was observed to range from 5 to 15 ft below ground surface (bgs) and the maximum anticipated depth to the bottom of the clay was 19 ft bgs [LACDPW, 2007]. As this clay layer is anticipated to limit the vertical infiltration of recharge water in the basins, removal and replacement of this low permeable layer is within the Project scope.

2.2.3 Hydrogeology

The Site is one of the major water conservation facilities that recharge the San Fernando Groundwater Basin by allowing percolation of the runoff water into the basin. The San Fernando Groundwater Basin covers an area of about 175 square miles. Annual groundwater recharge at the Site is 6,900 acre-feet, which provides enough water for 13,800 families per year [LACDPW, 2014]. Other recharge sources of the San Fernando Groundwater Basin are the Tujunga and Hansen Spreading Grounds.

The San Fernando Groundwater Basin is documented to contain identified areas of groundwater contamination based on water quality analyses [DWR, 2003]. The primary contaminants identified are Volatile Organic Compounds (VOCs) including trichloroethylene (TCE) and tetrachloroethylene (PCE), which have been identified in shallow zones northeast of the Site and in the vicinity of the Site (Figures 3 and 4). These contaminants are documented to have existed in groundwater encountered at depths as shallow as 200 to 280 ft below ground surface (bgs) [EPA, 1998]. A number of investigations have identified other chemicals in groundwater such as petroleum compounds, chloroform, nitrate, sulfate, and heavy metals [Setmire 1985; ULARAW 1999]. TCE, PCE and nitrate contamination occurs in the eastern part of the basin and elevated sulfate concentration occurs in the western part of the basin [ULARAW, 1999].

In the vicinity of the Site the depth to groundwater fluctuated between 300 ft and 350 ft bgs between the years 2004 and 2008 and the historic high groundwater level is approximately 210 ft bgs [LACDPW, 2009]. Groundwater in the area flows in a south-southwest direction [Kleinfelder, 2003].

2.2.4 Surface Water Hydrology

The northeast extents of the Pacoima Wash subwatershed encompass parts of the Angeles National forest and the southwestern portions of the subwatershed include urban areas of the San Fernando Valley. The subwatershed drains mainly into the Pacoima Wash (Figure 5).

The Site is located on the southernmost section of the Pacoima Wash subwatershed on the Pacoima Wash. The Pacoima Wash flows in a northeast-southwest direction through the Pacoima Spreading Ground subwatershed, originating in the upper reaches of the San Gabriel Mountains. The Pacoima Wash passes through the Pacoima reservoir/dam and the Lopez reservoir/dam where sandy debris carried from the mountains and undeveloped hillsides by the wash is captured and contained in a debris basin. At the southern end of the debris basin, the Pacoima Wash is directed into a concrete-lined channel that travels southwest towards the headworks at the Site, through residential neighborhoods and industrial areas. At this point characteristics of the wash are significantly influenced by the surrounding urban land use due to receiving surface water discharges (Figure 6). Figure 6 also shows select surface water drainage features from the Los Angeles County storm drain system. As shown in Figure 6, Pacoima Wash inflows are mostly discharges from the urban areas to the north of the wash including the water that drains into the East Canyon Channel which joins the Pacoima Wash on the northeast of the Site. In this concrete-lined portion of the Pacoima Wash, trash and other miscellaneous debris are commonly observed alongside and within the wash. As the Pacoima Wash continues southwesterly, it is funneled into a square culvert under the I-5 Freeway and SR-118 interchange (Figure 7) where the East Canyon Channel (with a northwest-southeast oriented flow) joins the Pacoima Wash and continues to the Site [Creel et al., 2004]. The East Canyon Channel is a concrete drainage channel that serves as one of the major flood control facilities in the area. The channel follows San Fernando Road to the East of Los Angeles Reservoir and at about Rinaldi Street it flows southeasterly along the I-5 Freeway.

2.3 Current Site Uses and Descriptions of Structures

The Site is currently used as spreading grounds to recharge the San Fernando Groundwater Basin. The Site is approximately 169 acres and has a storage capacity of 530 acre-feet (AF). The Site includes the following facilities:

- radial intake gate;
- intake canal;
- equipment storage / control room structures;

- 12 spreading basins (Figure 7);
- maintenance roads;
- spillways; and
- overflow weir.

The water is diverted from the Pacoima Diversion Channel using the radial gate located on the northeast end of the Site (headworks). The water then flows over a weir, through the intake canal, passing through pipes under Arleta Avenue to the spreading basins. The water percolates to the groundwater basin at the spreading grounds. The radial gate is lifted out of the channel slightly to allow excess flows of water to undershoot the gate and travel down the Pacoima Diversion Channel during high stormwater flows.

2.4 Current Adjoining Property Uses and Descriptions of Structures

The Site is located to the west of the Pacoima Diversion Channel and it is generally bounded to the north, south, east, and west by single-family residential (Figure 7). Adjacent properties included: single-family residential to the north, south, east and west; some commercial uses to the south; Devonshire Arleta Park and a plant nursery to the east and Devonwood Park to the west.

3. USER PROVIDED INFORMATION

In accordance with ASTM Standard E 1527-13, Geosyntec requested that the User of the Phase I ESA provide information that would assist in identifying RECs in connection with the Site. Based on BonTerra Psomas' recommendation, Geosyntec contacted Mr. John Bodenchak, Associate Civil Engineer at the LACDPW. Mr. Bodenchak and his manager Mr. Ken Zimmer, Head of Water Conservation Planning Section, provided the following information:

3.1 Title Records

A title report for the Site was not reviewed for purposes of the Phase I ESA. The Site has been owned by the LACFCD since the 1930s.

3.2 Environmental Liens or Activity and Use Limitations

Mr. Zimmer was not aware of any chemical releases, environmental cleanup activities, environmental liens, or land use limitations associated with the Site.

3.3 Specialized Knowledge

Mr. Zimmer stated that he has specialized knowledge or experience related to the Site. He indicated that he has 18 years of experience in spreading grounds operations and design at the LACFCD.

3.4 Commonly Known or Reasonably Ascertainable Information

Mr. Zimmer stated that he has knowledge of the past uses of the Site and indicated that the Site has been used for water conservation since its construction in the 1930s.

Mr. Zimmer indicated that a gasoline storage tank was located at the headworks area of the Site (location of this tank is shown in Appendix G). He also stated that currently herbicide is used on the Site and that Ferric chloride was used previously to aid in settlement of fines during operation of the spreading grounds.

Mr. Zimmer did not have knowledge of spills, chemical releases, and environmental cleanups that may have taken place at the Site.

3.5 Owner, Property Manager, and Occupant Information

Mr. Zimmer stated that the LACFCD has owned the Site since its construction in the 1930s.

3.6 Reason for Performing This Phase I ESA

Geosyntec understands that BonTerra Psomas and the Los Angeles County Flood Control District have requested this Phase I ESA to support the CEQA process regarding an upcoming basin enhancement Project at the Site.

3.7 Valuation Reduction for Environmental Issues

Mr. Zimmer indicated that this item is not applicable since the LACFCD has owned the Site since its construction in the 1930s and the Site is not being sold.

3.8 Other User Provided Information

Mr. Zimmer stated that based on his knowledge and experience related to the Site there have been indicators that point to the presence or likely presence of contamination at the Site. He referred to the previous environmental reports indicating potential for contamination. These reports are discussed in Section 4.4.

4. RECORDS REVIEW

4.1 Standard Environmental Records Database Search

In accordance with ASTM E 1527-13, Geosyntec reviewed applicable and reasonably accessible federal, state, and local records as part of this Phase I ESA. The environmental records review was performed in the form of an environmental database search by EDR, in an attempt to ascertain whether the Site or neighboring properties were suspected of having environmental conditions with the potential to impact (or have impacted) the soil and/or groundwater at the Site.

The database search revealed 41 facilities (onsite, adjoining and offsite) included in regulatory agency lists of known or potential hazardous waste facilities, landfills, hazardous waste generators, and disposal facilities in addition to properties under investigation. The information provided in the EDR report (Appendix B) was obtained from publicly available sources. The locations of the properties listed in the EDR report are plotted with a geographic information system (GIS). Specific records and search distances for these environmental databases were reported by EDR to be consistent with ASTM E 1527-13 and are included in the EDR report presented as Appendix B.

The database search results were screened and summarized in Table 1 based on the following criteria:

- facilities within less than 1/8 mile from the Site boundary;
- facilities within 1/3 mile of the Site boundary with contaminated soil vapor (this is the "approximate minimum search distance" as defined by ASTM 2600-10 for non-petroleum hydrocarbon chemicals of concern in soil vapor); and
- facilities beyond the Site boundary, projected to be up gradient of the Site, and listed as having groundwater contamination.

Table 1 presents a summary of the records, with a brief description of the each record, associated databases and EDR map IDs. The following describes the records associated with potential impact on the Site due to the nature of the facilities operations and chemical substances involved.

4.1.1 Site and Adjoining Property Record Results

EDR's search of available "reasonably ascertainable" government records found numerous listings within the ASTM-specified search distances. The Site and properties adjoining the Site encompass 17 of the 41 listed facilities in the EDR report. Among

these facilities the following are identified with potential or limited potential impact on the Site:

1) Former underground storage tanks (Pacoima Spreading Grounds), located on-Site at 10450 Arleta Avenue (labeled "C" on the EDR Radius Map presented in Appendix B): Two records of underground storage tanks were found at this location; a historical record (dated 1990) and a recent record (dated 2010). The recent record indicates a 250-gallon tank. The tanks contained gasoline that was used for the backup generator at the Site. The location of these tanks was reported to be on the northeast portion of the Site. No leak was reported. The records were listed in CA FID UST, HIST UST, LOS ANGELES CO. HMS, and HAZNET. These underground tanks have also been identified by previous Phase I ESAs.

2) Closed solid waste landfill facility (San Fernando City Landfill), located at Sharp Avenue and Paxton Street (labeled "34" on the EDR Radius Map presented in Appendix B): The closed landfill is located less than 1/8 mile northeast of the Site. This record was found in WMUDS/SWAT database.

3) Small quantity generator of hazardous waste (Southern California Gas Co.), located less than 1/8 mile northeast of the Site at 14201 Paxton Street (labeled "31" on the EDR Radius Map presented in Appendix B): The facility is listed in RCRA-SQG. No releases or violations were reported.

4) Underground injection wells (Chevron U.S.A. Inc.), located less than 1/8 mile west of the Site (labeled "12" on the EDR Radius Map presented in Appendix B): This facility is listed in the California Oil and Gas Wells database. The records indicate directionally drilled wells at this location.

5) Leaking underground storage tank (Arco #1575, BP west Coast Production LLC), located at 14761 Devonshire Street (labeled "D" on the EDR Radius Map presented in Appendix B): This facility is located less than 1/8 mile west of the Site which reportedly affected the soil only. The case has been closed. The record is listed in LUST, HAZNET, ERNNS, and CA FID UST.

6) A facility located at 14600 San Jose, less than 1/8 mile north of the Site, was listed as a hazardous waste generator (labeled "24" on the EDR Radius Map presented in Appendix B). No releases or violations were reported. The record was found in HAZNET database.

4.1.2 Other Offsite Record Results

Of the 41 facilities reported within a 1-mile radius of the approximate Site boundary 24 were offsite (facilities that are neither within the Site boundary nor adjoining). The locations of these facilities are shown on the Overview Map and Detail Map in the EDR report (Appendix B).

Based on a review of these database listings three (3) of the facilities appear to have the potential to impact the Site soils or groundwater below the Site (see table 1).

4.1.3 Orphan Sites

In addition to the 41 facilities identified and mapped in the EDR report, an additional eight (8) offsite properties were identified by EDR search as orphan sites. However due to the long distance of these facilities to the Site they are unlikely to have adversely affected the Site.

4.2 Local Regulatory Agencies

Geosyntec contacted the following federal, state, and local agencies and requested reasonably ascertainable records for the Site from the following agencies:

- Department of Toxic Substances Control (DTSC);
- City of Los Angeles Public Works – Industrial Waste;
- South Coast Air Quality Management District (SCAQMD);
- Regional Water Quality Control Board (RWQCB);
- Los Angeles County Public Health Investigator;
- City of Los Angeles Fire Department (LAFD); and
- City of Los Angeles Building Department.

Geosyntec provided the aforementioned agencies with Site location information such as maps, street address (10450 Arleta Avenue) and parcel numbers at the time of request. The above agencies did not have records associated with the Site with the exception of the LAFD. A permit record for the removal of a 250-gallon unleaded gasoline dated 1 July 2014 was found in the LAFD records associated with 10450 N Arleta Avenue (the Site).

4.3 Historical Documentation Review

4.3.1 Historical Aerial Photographs and Topographic Maps

As part of this Phase I ESA, an aerial photograph and topographic map review was conducted. Historical USGS topographic maps for years 1896 to 1995 and aerial photographs from 1928 to 2012 were obtained from EDR and are provided in

Appendices A and D, respectively. Based on a review of these maps and photographs, a summary of the Site developments and historical use is as follows:

- The 1900 topographic map does not show structures in the immediate vicinity of the Site.
- In 1928 other than some man-made features to the northeast, the Site appears to be undeveloped for the most part. The Pacoima wash has formed a debris basin which is not bound by roads at this time.
- The 1938 aerial photograph shows that the wash has been channelized and initial construction of the spreading grounds has begun.
- In the 1952 aerial photograph the Site appears to be bound by roads and the Site configuration is visible.
- Devonshire Street appears on the 1976 aerial photograph and minor changes to the Site configuration are visible.
- In the 1989 aerial photograph the Site configuration appears very similar to the current configuration.
- Post 1989 minor modifications to the Site and a change in vegetation are noticeable.

4.3.2 Sanborn Fire Insurance Map Review

The Sanborn Library fire insurance maps were searched by EDR. The search results however indicated that Sanborn fire insurance maps covering the Site were not available.

4.3.3 City Directories

City Directories were searched by EDR for select years from 1920 to 2013 to assess occupancy at the Site and adjoining properties (Appendix F). The address associated with the headworks at the Site (10450 Arleta Avenue, Pacoima, California) was not identified in the city directories. The findings of the City Directories search however includes information corresponding to some of the adjoining properties mostly located on Devonshire Street near the western boundary of the Site.

4.4 Additional Environmental Record Sources

Geosyntec was provided with copies of prior environmental site assessment reports. The following lists the reports provided and a summary of relevant information:

- Prior Phase I ESA titled: "Pacoima Spreading Grounds, Phase I Site Assessment, Pacoima, California" conducted in May 2002 by Geotechnical and Materials Engineering Division of Los Angeles County Department of Public Works.
    - The report identifies a "moderate level of risk in terms of the potential presence of significant contamination problems resulting from hazardous materials, including petroleum hydrocarbons, as defined under applicable Federal and State environmental laws" due to close proximity of the closed San Fernando Landfill and an unnamed landfill to the northeast of the Site.
    - The report recommends that a Phase II Environmental Site Investigation be performed to evaluate the potential presence of environmental contamination at the Site.
- Prior Phase I ESA titled: "Phase I Environmental Site Assessment, Pacoima Spreading Grounds, 10450 Arleta Avenue, Pacoima, California" conducted in March 2003 by Kleinfelder.
    - The following RECs were identified:
        - potential presence of methane and other oil well related gases within subsurface soils at the Site due to the oil and gas wells located in the immediate vicinity of the Site;
        - potential landfill gases at the Site due to the former San Fernando Landfill referenced to be located at the intersection of Sharp Avenue and Paxton Street, northeast of the Site; and
        - observed oil staining northeast of the Site and south of the water diversion equipment with unknown subsurface impact.
    - The report indicates an on-Site 750-gallon septic tank on the northeast portion of the Site, at the headworks, that was installed in 1932. The septic tank is reportedly constructed with concrete and currently exists at the Site.

- The report recommends performing a soil gas survey to assess the potential impact from the closed landfill and the oil wells in addition to sampling soil at the oil stain to assess chemical impact to the subsurface.

- Prior Phase II ESA titled: "Report of Limited Subsurface Environmental Site Assessment, Pacoima Spreading Grounds Headworks, 10450 Arleta Avenue, Pacoima, California" conducted in April 2003 by Kleinfelder.

  - This assessment included the drilling of 30 borings and the collection of 40 soil samples for laboratory testing on the northeast portion of the Site, at the headworks.

  - The soil samples were analyzed for total petroleum hydrocarbons (gasoline, and diesel range), VOCs, total recoverable petroleum hydrocarbons, organochlorine pesticides, PCBs, California Title 22 metals and chlorinated herbicides.

  - VOCs, PCBs, herbicides and pesticides were not detected in soil samples.

  - Hydrocarbons were detected at concentrations ranging from 1.36 to 85.4 milligrams per kilogram (mg/kg). Petroleum hydrocarbons in soil were not vertically delineated.

  - With the exception of lead, concentrations of detected metals were below the U.S. EPA Residential Preliminary Remediation Goals (PRGs). Lead was detected in one sample at 5 ft bgs at a concentration of 155 (mg/kg). Based on this result the Waste Extraction Test (WET) was performed resulting in a concentration of 9.11 milligrams per liter. This concentration is greater than the Soluble Threshold Limit Concentration (STLC) used for hazardous waste classification.

  - A soil gas survey was also recommended depending on the future uses of the Site.

5. SITE RECONNAISSANCE AND INTERVIEWS

5.1 Methodology and Limiting Conditions

Geosyntec conducted a reconnaissance of the Site on 2 February 2015 to assess the environmental conditions on and around the Site. Mr. John Bodenchak, LACDPW's Associate Civil Engineer, provided escort during the Site reconnaissance and provided access to the Site and associated facilities. Mr. Bodenchak has worked for the LACDPW for about seven (7) years and particularly on the Site for about four (4) years. Mr. Octaviano Fernandez, Flood Control Construction Supervisor, was also present during the Site reconnaissance.

As part of the Site reconnaissance, Geosyntec looked for evidence regarding hazardous substances use, storage, or disposal at and in the vicinity of the Site. Moreover, Geosyntec evaluated the Site for areas of disturbed or discolored soil, suspect equipment, which may contain hazardous substances, areas of distressed vegetation, wastewater discharge areas, storage tanks/septic systems, waste management/disposal areas, lagoons, pits, sumps, surface water management areas, and stained surfaces.

Adjoining properties were observed from the perimeter of the Site or via access roads. Select photographs taken during the Site reconnaissance are presented in Appendix G.

5.2 General Site Setting

5.2.1 Current Use of the Site

At the time of Geosyntec's performance of this Phase I ESA, the Site consisted of a northeastern area known as the "headworks" in the vicinity of the intake canal where water diversion equipment, office/supply structures, and a gate operation structure were located. The radial gate at the headworks is used to divert the water from Pacoima Diversion Channel to the spreading grounds. The spreading basins were situated to the southwest of the headworks and comprised the majority of the Site area. This is where the runoff water percolates into the basin soils and recharges the groundwater.

5.2.2 Current Use of Adjoining Properties and the Surrounding Area

The area surrounding the Site is mostly residential. However, two parks, the Devonshire Arleta and Devonwood parks are located on the east and west side of the Site, respectively. A plant nursery and a vacant triangular shaped gravel padded area are located to the northeast of the Site. According to previous ESAs and Mr. Bodenchak this vacant area is where the oil and gas wells were previously located.

The closed San Fernando City Landfill is located on Sharp Avenue and Paxton Street, across from the headworks at the Site.

5.3 Observations

5.3.1 Hazardous Substances and Petroleum Products

Geosyntec observed a hazardous materials storage container kept at the northeast corner of the Site. The LACDPW personnel described the stored materials as paint. The container was closed and no significant evidence of staining or spills was observed.

Two 250-gallon underground storage tanks used for the backup generator were formerly located in the headworks area near the generator. According to Mr. Octaviano these tanks have been removed from the Site. The previous location of the underground tanks is shown in Appendix G.

The area where the oil and gas wells previously located off-Site to the northeast of the headworks was visited and it appeared to be mostly covered with gravel.

No other hazardous substances or petroleum products were observed during the Site reconnaissance.

5.3.2 Storage Tanks

No evidence of existing underground or aboveground storage tanks was observed during the Site reconnaissance. The location of a previously existing underground storage tank however was noted.

5.3.3 Odors

No strong, pungent, or noxious odors were observed at the Site during the Site reconnaissance.

5.3.4 Pools of Liquid

Pools of liquid were not observed at the Site (other than the residual water in the designated intake canal) during the Site reconnaissance.

5.3.5 Drums or Containers and Unidentified Substances/Containers

Drums were not observed at the Site at the time of Geosyntec's Site reconnaissance. However, Mr. Bodenchak indicated that chemical coagulants (ferric chloride) were previously used at the spreading grounds to aid in settlement of fines.

5.3.6 Indications of Polychlorinated Biphenyls (PCBs)

During the Site visit, Geosyntec did not observe transformers on-Site, however, lighting ballast was observed in lighting fixtures. Lighting ballast installed prior to 1979 may contain small amounts of PCBs and should be disposed of properly when eventually discarded.

5.3.7 Heating and Cooling System

A Heating Ventilation and Cooling (HVAC) system was observed in a small control room structure at the headworks.

5.3.8 Stains or Corrosion

Geosyntec did not observe significant areas of ground staining at the time of the Site reconnaissance. However some degree of corrosion was observed in the intake canal.

5.3.9 Drains and Sumps

Geosyntec did not observe drains or sumps at the time of the Site reconnaissance.

5.3.10 Pits, Ponds, and Lagoons

Only pits, ponds and lagoons associated with the spreading ground activities were observed. No evidence of hazardous materials was observed during the Site reconnaissance.

5.3.11 Stained Soil or Pavement

Geosyntec did not observe significantly stained soil or pavement at the subject Site.

5.3.12 Stressed Vegetation

No stressed vegetation was observed at the Site during the Site reconnaissance.

5.3.13 Solid Waste

No evidence of filled areas was observed. However some solid waste (mostly trash, tires, etc.) was observed near the perimeter fences and within the spreading grounds. No evidence of illicit dumping of potentially hazardous substances was noted during the Site reconnaissance.

The location of the closed San Fernando City Landfill located off-Site was visited and the area appeared to be covered by vegetation.

5.3.14 Wastewater or Stormwater Discharge

No evidence of onsite storm drains or other wastewater discharge was observed during the Site reconnaissance. The Pacoima Wash that drains to the Site however carries stormwater discharges from the surrounding area.

5.3.15 Wells

Piezometers were observed around the spreading grounds that are used to measure the depth to water.

5.3.16 Septic Systems

While no evidence of septic systems was observed during the reconnaissance, Mr. Bodenchak described a 750-gallon septic tank that was installed in the northeastern portion of the Site in 1932.

6. INTERVIEWS

6.1 Interview of Property Owner

On 2 February 2015 Geosyntec interviewed Mr. John Bodenchak, Associate Civil Engineer and Mr. Octaviano Fernandez, Flood Control Construction Supervisor. During the interview, questions were asked regarding Site use and conditions, typical of a Phase I ESA interview in accordance with ASTM E 1527-13.

Mr. Bodenchak indicated that currently a hazardous materials storage container is kept at the northeast corner of the Site. According to Mr. Bodenchak the container only holds cans of paint that is used to clean up graffiti. Mr. Bodenchak also stated that pesticides and herbicides are applied to the grounds. Mr. Fernandez indicated that an underground storage tank that contained gasoline and was used to fuel the backup generator was removed from the Site more than a year ago.

Mr. Bodenchak and Mr. Fernandez did not have knowledge of any other hazardous materials/waste.

On 5 February 2015 Mr. Ken Zimmer, Head of Water Conservation Planning Section also provided information regarding current use of herbicides and previous use of ferric chloride (to aid settlements of fines at the spreading grounds) at the Site. Mr. Zimmer indicated that an underground storage tank containing gasoline was previously located at the Site (on the northeast portion at the headworks).

6.2 Interview with Others

No other interviews were conducted as part of this Phase I ESA.

7. EVALUATION

7.1 Findings and Opinions

Based on the information identified and reviewed, other key findings of the Phase I ESA include:

- The Site includes the southernmost portions of the Pacoima Spreading Grounds subwatershed and is located in the northern portion of the San Fernando Valley near the intersection of Devonshire Street and Arleta Avenue, Los Angeles, California.

- The Site facilitates the groundwater basin recharge by receiving the Pacoima Wash water and spreading in through the basins allowing for water percolation through the spreading grounds.

- Two (250-gallon) underground storage tanks containing gasoline were located on-Site at 10450 Arleta Avenue (northeast portion of the Site). These tanks have reportedly been removed from the Site.

- The closed San Fernando City Landfill is located adjacent to the northeast portion of the Site and the intake canal. Landfill gas migration from the closed landfill to the Site is a potential concern.

- Oil and gas wells were previously in operation adjoining the Site.

- A septic tank is reportedly located on the northeast portion of the Site (near the east-central portion of the headworks). This 750-gallon tank was installed in 1932 and was constructed with concrete.

- Kleinfelder conducted soil sampling and testing on the northeast portion of the Site (at the headworks). The testing resulted in detection of hydrocarbons at concentrations ranging from 1.36 to 85.4 (mg/kg). These concentrations are well below the general accepted action level; however petroleum hydrocarbons in soil were not vertically delineated. Lead was also detected in one sample at 5 ft bgs at a concentration of 155 (mg/kg). Additional soil analytical (i.e., WET test) results indicated a lead concentration of greater than the STLC used for hazardous waste classification.

- Underground injection wells have been recorded to be located west of the Site. These wells are listed in California Oil and Gas Wells database and are reported to have been abandoned [DOGGR, 2015].

7.2 Conclusions

Geosyntec has performed a Phase I ESA of the Site, located in the northern portion of the San Fernando Valley near the intersection of Devonshire Street and Arleta Avenue, Los Angeles, California, in conformance with the scope and limitations of ASTM Practice E1527-13. Any exceptions to, or deletions from this practice, are described in Sections 1, and 7.3 of this report. This assessment has revealed evidence of recognized environmental conditions RECs in connection with the Site as follows:

- Potential migration of gases: The closed San Fernando City Landfill, and the abandoned oil and gas wells located adjacent to the Site (northeast of the Site) are potential sources of gas migration to the Site.

- Previous subsurface investigations: Petroleum hydrocarbons and lead were detected during previous subsurface investigations on the northeast portion of the Site. Hydrocarbons concentrations ranged from 1.36 to 85.4 (mg/kg). Petroleum hydrocarbons in soil were not vertically delineated. WET test results indicated a lead concentration of greater than the STLC used for hazardous waste classification.

- Underground storage tanks: Two (250-gallon) underground storage tanks containing gasoline that were located on-Site at 10450 Arleta Avenue (northeast portion of the Site) may be associated with potential impact to the Site. Soil sampling and testing at this location following removal of the tank in 2014 has not been performed / reported.

7.3 Data Gaps

In accordance with ASTM E1527-13, this section documents data gaps in the information obtained and reviewed as part of this Phase I ESA and discusses the associated significance. A data gap is defined in ASTM E1527-13 as being "… *a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information*". The only data gap in this environmental site assessment is the records requested from the City of Los Angeles Fire Department Plan Check and Underground Storage Tank Division. At the time of this report Geosyntec had not received any records from this agency.

7.4 Exceptions and Deviations

In performance of this Phase I ESA, Geosyntec has not identified potential exceptions or deviations from the ASTM E 1527-13 standard of practice except where noted.

7.5 Qualifications of Environmental Professionals

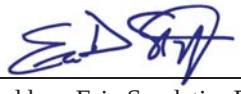
This Phase I Environmental Site Assessment was performed by Dr. Zahra Amini and Mr. Brian Cozzens of Geosyntec. The Phase I ESA was performed under the oversight of Mr. Eric Smalstig P.E., and Mr. Mike Reardon, P.E. Mr. Reardon and Mr. Smalstig are Environmental Professionals as defined by the ASTM E1527-13 standard. As lead reviewer, Mr. Reardon's professional qualifications are provided in Appendix H.

7.6 Signature by Environmental Professionals

We declare, that to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR §312.

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Site. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Signed by: Mike Reardon, P.E. – Associate



Signed by: Eric Smalstig, P.E. – Principal

NOTES:

1. The areas of contamination shown on this map represent generalized two-dimensional approximations based on water quality analysis from RI Monitoring Wells, Facility Wells, and Production Wells where the top of screened interval is within 50 feet of the water table.
2. Due to the possible vertical zonation of contamination, a well within an identified area of contamination may produce water with contamination different than that indicated on this map.
3. Areas of contamination are based on: the highest concentration during 1998 sample events for RI wells sampled quarterly; the highest concentration during the previous two sample rounds (or 18 months) for wells sampled annually; and, the most recent record available for wells sampled more than 18 months prior to most recent sample event.
4. Areas outside the zones represented here may be contaminated. Data available in the areas outside the zones represented on this map are below the detection limit of 2 µg/l.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 09/29/2014 has revealed that there is 1 NPL

site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SAN FERNANDO VALLEY (AREA 1)	***NORTH HOLLYWOOD WELLFIE***	***NE 1/2 - 1 (0.770 mi.)***	***0***	***8***

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 06/10/2014 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
AMERICAN ETCHING AND MFG.	***13730 DESMOND ST***	***NE 1/2 - 1 (0.733 mi.)***	***H62***	***142***

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 06/10/2014 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SAN JOSE STREET ELEMENTARY SCH	14928 CLYMER ST	NW 1/8 - 1/4 (0.198 mi.)	45	113

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/10/2014 has revealed that there are 2 RCRA-SQG sites within approximately 0.25 miles of the target property.

Federal ERNS list

ERNS: The Emergency Response Notification System records and stores information on reported releases of oil and hazardous substances. The source of this database is the U.S. EPA.

A review of the ERNS list, as provided by EDR, and dated 09/29/2014 has revealed that there are 3 ERNS sites within approximately 0.001 miles of the target property.

State- and tribal - equivalent NPL

RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the RESPONSE list, as provided by EDR, and dated 11/03/2014 has revealed that there are 2 RESPONSE sites within approximately 1 mile of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 11/03/2014 has revealed that there are 13 ENVIROSTOR sites within approximately 1 mile of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 06/10/2014 has revealed that there are 2 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, and dated 12/31/2013 has revealed that there are 9 HAZNET sites within approximately 0.001 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR US Hist Auto Stat: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR

researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Auto Stat list, as provided by EDR, has revealed that there are 10 EDR US Hist Auto Stat sites within approximately 0.25 miles of the target property.

EDR US Hist Cleaners: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Cleaners list, as provided by EDR, has revealed that there are 5 EDR US Hist Cleaners sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR RECOVERED GOVERNMENT ARCHIVES

Exclusive Recovered Govt. Archives

RGA LUST: The EDR Recovered Government Archive Leaking Underground Storage Tank database provides a list of LUST incidents derived from historical databases and includes many records that no longer appear in current government lists. Compiled from Records formerly available from the State Water Resources Control Board in California.

A review of the RGA LUST list, as provided by EDR, has revealed that there is 1 RGA LUST site within approximately 0.001 miles of the target property.

Summary Details:

Conditions at proposal October 15, 1984): San Fernando Valley Area l) is an area of contaminated ground water in the vicinity of the North Hollywood section of the City of Los Angeles, Los Angeles County, California. This area is part of the San Fernando Valley Basin, a natural underground reservoir that represents an important source of drinking water for at least 3 million people in the Los Angeles metropolitan area. The contaminated ground water, which underlies an area of approximately 5,l56 acres, contains trichloroethylene TCE) and perchloroethylene PCE), and to a lesser extent, carbon tetrachloride and chloroform, according to analyses conducted by the California Department of Health Services, as well as numerous local government agencies. The State s recommended drinking water guideline for TCE and PCE 5 and 4 parts per billion respectively) are exceeded in a number of public wells in this area. To alleviate this contamination, wells are eithertaken out of service or blended with water from clean sources to ensure that the public receives water with TCE/PCE concentrations below the State s guidelines. Status June 10, 1986): EPA and the Los Angeles Department of Water and Power are entering into a cooperative agreement for a remedial investigation of the San Fernando Valley Basin and a feasibility study targeted at Area 1, the most contaminated area. The RI is scheduled to begin in early 1986.

Site Description: The North Hollywood-Burbank Well Field is located within the North Hollywood National Priorities List (NPL) Site, which is one of four NPL sites in the San Fernando Valley. It is also located in the San Fernando Valley Groundwater Basin. The sites were proposed for inclusion on the NPL because of the discovery of trichloroethylene and other volatile organic contaminants (VOCs) in the groundwater. The San Fernando Valley Groundwater Basin comprises 112,000 acres of valley fill situated among the Coastal Ranges within the Los Angeles metropolitan area. The area is used for residential, commercial, and industrial purposes. Groundwater from the basin is distributed by various municipalities and water districts to the residents of the metropolitan area. The Los Angeles Department of Water and Power (DWP) operates the North Hollywood-Burbank Well Field to provide drinking water to the residents of the City of Los Angeles, located to the south of the San Fernando Valley. The San Fernando Groundwater Basin can provide drinking water for approximately 500,000 people

SAN FERNANDO VALLEY (AREA 1) (Continued) **1000709322**

residing in the San Fernando Valley and Los Angeles. In times of water shortages, the groundwater shortage can be drawn upon to supply about one million people. It is also an important source of water for the Cities of Burbank, Glendale, and San Fernando. The North Hollywood Operable Unit (NHOU) is one of two geographically-defined operable units within the San Fernando Valley (SFV) (Area 1) Superfund Site. The NHOU comprises approximately 4 square miles of contaminated groundwater underlying an area of mixed industrial, commercial, and residential land use in the community of North Hollywood (a district of the City of Los Angeles). The NHOU is approximately 15 miles north of downtown Los Angeles and immediately west of the City of Burbank, and has approximate Site boundaries of Sun Valley and Interstate 5 to the north, State Highway 170 and Lankershim Boulevard to the west, the Burbank Airport to the east, and Burbank Boulevard to the south. The EPA is the lead agency for the current and planned future groundwater remedial activities at the NHOU. The EPA's response activities at the NHOU are and have been conducted under the authority established in the federal Superfund law, the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended, 42 U.S.C. Section 9601 et seq. The lead state agency is the California Department of Toxic Substances Control (DTSC). The Los Angeles Regional Water Quality Control Board (RWQCB) has provided and continues to provide substantial support, particularly with the investigation and cleanup of sources of contamination in the SFV. The expected source of cleanup monies for the NHOU is an enforcement settlement with the Potentially Responsible Parties (PRPs). Prior to World War II, most land in the SFV was occupied by farms, orchards, and ranchland. By 1949, after the war, nearly all the land in Burbank and North Hollywood was occupied by housing developments, industrial facilities, retail establishments, and the Burbank Airport. Accompanying these land use changes in the 1940s was a substantial increase in population and groundwater withdrawals from the SFV. In the 1950s, the North Hollywood, Erwin, Whitnall, and Verdugo Well Fields were constructed by the Los Angeles Department of Water and Power (LADWP) in the North Hollywood area to meet the increasing demand for water. In 1968, groundwater withdrawals from the SFV were reduced to achieve "safe yield" from the basin, and more surface water was imported to the basin from external sources. In 1979, industrial contamination was found in groundwater in the San Gabriel Valley (to the east of the SFV), prompting the California Department of Public Health (CDPH; formerly the California Department of Health Services) to request that all major water providers in the region, including those in the SFV, sample and analyze groundwater for potential industrial contaminants. Trichloroethylene (TCE) and tetrachloroethylene (PCE) were consistently detected in a large number of production wells in the SFV at concentrations greater than Federal and State Maximum Contaminant Levels (MCLs) for drinking water. TCE and PCE were widely used in the San Fernando Valley starting in the 1940s for dry cleaning and for degreasing machinery. Disposal was not well regulated at that time, and releases volatile organic compound (VOC)-contaminated groundwater that extends from the NHOU to the southeast. To replace wells within the NHOU area contaminated by TCE and PCE, and to provide more operational flexibility for groundwater recharge and pumping in the SFV, LADWP constructed the Rinaldi-Toluca Well Field in 1988 and 1989, and the Tujunga Well Field in 1993. Based on the significant levels of groundwater contamination present in the SFV and the impact of that contamination on numerous municipal water supply wells, EPA added four SFV Sites to the National Priorities List (NPL) in 1986 and defined them as areas of regional groundwater contamination. Three of the four Sites (Areas 1, 2 and 4) are contiguous areas within whose boundaries are well fields that serve the water supply systems for the cities of Los Angeles, Burbank and Glendale. There is a large, continuous plume of groundwater contamination that runs through these three Sites. The fourth Site, Area 3,

SAN FERNANDO VALLEY (AREA 1) (Continued) **1000709322**

lies in the Verdugo basin, a geographically separate area of the eastern San Fernando Valley. In the SFV Area 1 Site, located at the upgradient end of the contaminated groundwater plume, the selection and implementation of the initial interim remedy - the Existing NHOU Extraction and Treatment System - for the LADWP's North Hollywood well field was given fast-track status because of the potential for contamination to spread to other well fields and areas of uncontaminated groundwater. In 1986, LADWP completed the Operable Unit Feasibility Study for the North Hollywood Well Field Area of the North Hollywood-Burbank NPL Site, which was the basis for selection and implementation of the Existing NHOU Extraction and Treatment System. The 1987 Record of Decision (ROD) for the Site selected the Existing NHOU Extraction and Treatment System as an interim groundwater containment remedy. In 1989, LADWP constructed the Existing NHOU Extraction and Treatment System with financial support from EPA. The Existing NHOU Extraction and Treatment System consists of eight groundwater extraction wells (NHE-1 through NHE-8), an air-stripping treatment system to remove VOCs from the extracted groundwater, activated carbon filters to remove VOCs from the air stream, and ancillary equipment. The treated groundwater is discharged into an LADWP blending facility where it is combined with water from other sources before entering the LADWP water supply system. The Existing NHOU Extraction and Treatment System commenced operation in December 1989 and remains in operation today. In 1989, EPA issued a ROD for the Burbank OU (BOU) of the SFV Area 1 Site. That ROD also selected an interim remedy (containment) for the VOC-contaminated groundwater within the Burbank area, where ten of the city's water supply wells had been shut down due to contamination. The BOU remedy, which provides treated water for the City of Burbank's water supply system, began operation in 1996 and remains in operation to this day. OU01 1991 ESD: In June 1986, the United States Environmental Protection Agency (EPA) evaluated the threat posed by a number of well fields within the San Fernando and Verdugo Groundwater Basins, and designated them as National Priorities List (NPL) hazardous substance sites. Industrial chemicals had been detected in groundwater from these areas. Although four sites in the basin were listed on the NPL, EPA and DWP are managing the investigation of the four sites and the adjacent area as a single project consistent with the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) Section 104(d)(4). The San Fernando Valley Groundwater Basin (SFVGB) has historically been, and continues to be, an important source of drinking water for the Los Angeles metropolitan area, including the unincorporated area of La Cresenta, and the cities of Burbank, Glendale, and San Fernando. The groundwater basin provides these communities with enough water to serve approximately 600,000 residents. Groundwater from the SFVGB is used for residential, commercial, and industrial purposes, and is especially important during years of drought. The groundwater that has become contaminated is difficult to replace. The current water supply from surface water may not always be available in the future because of periodic drought conditions and state and federal water rights issues. The Burbank Operable Unit (OU) was developed to address the areal extent of groundwater contamination that is presently generally located in the area of the Burbank Well Field and including any areas to which the groundwater contamination migrates. The Site is part of the SFV Area 1 (North Hollywood) NPL site and includes an area beyond that originally designated as SFV Area 1. The City of Burbank's production wells have been shut down because the water they produce contained trichloroethylene (TCE) and perchloroethylene (PCE) in concentrations exceeding state and federal maximum contaminant levels (MCLs). Consequently, the City of Burbank now purchases 100 percent of its water, which is imported supply, from the Metropolitan Water District of Southern California (MWD). On June 30, 1989, the U.S. Environmental Protection Agency (EPA) signed a Record of Decision (ROD) for the San Fernando

SAN FERNANDO VALLEY (AREA 1) (Continued) **1000709322**

Valley (SFV) Area 1 - Burbank Operable Unit (Burbank OU). The Burbank OU is the second OU, but is named OU03 at the SFV Area 1 NPL site. The purpose of this Explanation of Significant Differences (ESD) is to explain the significant differences between the interim remedial action originally selected in the 1989 ROD and the interim remedy which will be implemented at the Site. EPA is issuing this ESD in order to take into account technical data received after the ROD was signed in June of 1989 and to clarify any ambiguities regarding the selected remedy. An Explanation of Significant Differences addressing OU01 the San Fernando Site was completed in November, 1990. Operable Unit 3: The following gives a brief background of the Burbank Operable unit (OU) and a short summary of the remedy selected in the Record of Decision (ROD) and modified by Explanation of Significant Differences (ESD) 1. Further background information can be found in the ROD (dated June 30, 1989), and in ESD1 (dated November 20, 1990), as well as in other documents in the Burbank OU Administrative Record. In June 1986, the U.S. Environmental Protection Agency (EPA) evaluated the threat posed by groundwater contamination at a number of water supply wellfields within the San Fernando Valley and Verdugo groundwater basins. The chief contaminants of concern are trichloroethylene (TCE) and perchloroethylene (PCE). As a result of its investigation, EPA designated four wellfield areas as National Priorities List (NPL) sites. EPA is managing the four sites as a single project consistent with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Section 104(d)(4). The San Fernando Valley Groundwater Basin has historically been an important source of drinking water for the Los Angeles metropolitan area, including the City of Burbank. The groundwater basin provides enough water to serve approximately 600,000 residents. Groundwater extracted from the basin is especially important during years of drought. Due to contamination by volatile organic chemicals (VOC), including TCE and PCE, beneficial use of the groundwater resource has been partially lost. Surface water supplies have replaced the lost resource, but are costly, and may not be available in the future due to periodic drought conditions and the potential for changing water rights policy. The Burbank OU is located within the San Fernando Valley groundwater basin and encompasses wellfields which were operated by the City of Burbank prior to being shut down as a result of contamination. The Burbank OU was specifically developed to address this areal extent of groundwater contamination. The City of Burbank's production wells have been shut down since the early 1980s because of the presence of TCE and PCE in concentrations exceeding federal and state Maximum Contaminant Levels (MCL). Consequently, the city purchases close to one hundred percent of its water from the Metropolitan Water District of Southern California, which supplies surface water imported from outside the San Fernando basin. (The city does operate a granular activated carbon groundwater extraction and treatment plant during parts of the year, but the contribution of this plant toward meeting the overall water demand is small). On June 30, 1989, EPA signed a Record of Decision (ROD) for the San Fernando Valley Area 1 Superfund Site, Burbank Operable Unit OU. On November 21, 1990, EPA signed an Explanation of Significant Differences (ESD1) modifying the interim remedial action selected in the ROD. A second ESD addressing the Burbank Operable Unit (Operable Unit 3) at the San Fernando Valley (Area 1) site was completed in February 1997. In December 1992, a remedial investigation (RI) for the SFV groundwater basin, including installation and subsequent regular monitoring of 84 groundwater wells, was completed under a cooperative agreement between EPA and the LADWP. The RI was conducted to evaluate the groundwater quality throughout the SFV basin and assist in identifying the best treatment method(s) and optimal locations to install groundwater treatment systems to address the SFV groundwater contamination EPA listed the SFV Sites as groundwater only, with the intent to focus on addressing the regional groundwater contamination, with an

SAN FERNANDO VALLEY (AREA 1) (Continued) **1000709322**

agreement with the state agencies to address the sources. From the late 1980s to late 1990s, EPA provided funds to RWQCB to conduct assessments of facilities in the SFV to determine the extent of solvent usage and to assess past and current chemical handling, storage, and disposal practices. These investigations were conducted pursuant to RWQCB's Well Investigation Program and resulted in source remediation activities under RWQCB oversight at several facilities within the SFV, including two within the NHOU. Source investigations and remediation activities are currently in progress under the lead of RWQCB and DTSC. In 1993, 1998, 2003, and 2008, EPA conducted five-year reviews (as required by CERCLA) to evaluate the protectiveness of the NHOU interim remedy. The Third NHOU Five-Year Review reported that the TCE and PCE groundwater plume that the remedy was designed to capture was migrating vertically and laterally beyond the remedy's zone of hydraulic control. This conclusion was based largely on EPA's evaluation of the current NHOU groundwater conditions and LADWP findings in the Draft Evaluation of the North Hollywood Operable Unit and Options to Enhance Its Effectiveness. The Final Evaluation of the North Hollywood Operable Unit and Options to Enhance Its Effectiveness also raised concerns regarding detections of total chromium and hexavalent chromium in extraction well NHE-2 of the NHOU interim remedy. Well NHE-2 is located just a short distance from the former Bendix facility, one of the major VOC sources in the NHOU. In July 2006, after a year of unusually high rainfall and rising groundwater levels in the SFV, the total chromium concentration detected at NHOU extraction well NHE-2 began to increase. Chromium was used in the metal plating and aerospace industry (metal fabrication), as well as for corrosion inhibition in industrial cooling towers, from the 1940s through the 1980s. It was also used extensively at the former Bendix facility. In 2007, the elevated concentrations of chromium at well NHE-2 caused total chromium concentrations in the combined NHOU treatment system effluent to exceed 30 micrograms per liter (ug/L) (60 percent of the state MCL). As a result, CDPH advised LADWP to shut down well NHE-2 or divert the water produced by the well to a nonpotable use. Chromium concentrations at this well have subsequently ranged from approximately 280 to 440 ug/L. In addition, 1, 4-dioxane was detected at well NHE-2 during 2007 and 2008 at concentrations ranging from 4 to 7 ug/L. There is no MCL for 1, 4-dioxane, but the CDPH notification level for 1, 4-dioxane is 3 ug/L. Extraction well NHE-2 remained shut down until September 2008, when the installation of a wellhead VOC treatment unit and modification of the discharge piping were completed, which allowed this well to return to service. The NHE-2 effluent, which still contains elevated levels of chromium, is currently discharged to the Los Angeles Bureau of Sanitation sewer system. This work was conducted by Honeywell International (a corporate successor to Bendix) as an interim measure, pursuant to a Cleanup and Abatement Order (CAO) from RWQCB that requires Honeywell to clean up the chromium contamination and to restore lost water caused by the shut down of well NHE-2. A long-term wellhead treatment system for well NHE-2, including treatment for chromium and, if necessary, 1,4-dioxane, to meet drinking water standards is expected to be implemented pursuant to the RWQCB CAO prior to the implementation of the NHOU Second Interim Remedy. Following construction and start up of the Existing NHOU Extraction and Treatment System, EPA issued general and special notice letters to PRPs. In 1996 and 1997, EPA reached two separate settlements with PRPs in which the settling parties agreed to pay EPA's past costs and fund operation of the Existing NHOU Extraction and Treatment System for the remainder of its fifteen-year term. In 2008, when the funds collected pursuant to the 1996 and 1997 settlements were close to being exhausted, EPA entered into an administrative order on consent with a number of parties from 1996 and 1997 settlements and issued a unilateral administrative order to the remaining viable parties in order to secure funding to continue operating the Existing NHOU Extraction and Treatment System until the Second

SAN FERNANDO VALLEY (AREA 1) (Continued) **1000709322**

Interim Remedy is constructed and operational. In preparation for the selection and implementation of the Second Interim Remedy, EPA has conducted additional PRP search activity. The RWQCB has issued CAOs to two parties in the NHOU. In December 1987, Lockheed was issued a CAO directing it to remediate contaminated soil and groundwater at Plant B-1 (in the BOU) and to complete a comprehensive Site assessment at all of Lockheed's other Burbank Airport facilities, including Plants B5 and C1 (in the NHOU), to determine the sources and extent of soil and groundwater contamination. The RWQCB issued a CAO in February 2003 to Honeywell International, Inc., for VOC and chromium contamination in groundwater at the former Bendix facility in North Hollywood. This CAO was amended in April 2007 to include investigation and mitigation of emerging contaminants at the former Bendix facility and to address elevated chromium concentrations at NHOU extraction well NHE-2. The land use in the SFV Area 1 Site, including the NHOU, consists of mixed residential, industrial, and commercial use. The SFV is fully developed and land uses in the NHOU are not expected to change significantly in the next 20 years or longer. The SFV groundwater basin is an important source of drinking water for the Los Angeles metropolitan area, including the cities of Los Angeles, Glendale, Burbank, and San Fernando. The SFV is located in the Upper Los Angeles River Area (ULARA), which is under adjudicated water rights regulated by the ULARA Watermaster. Through court action in 1975, the City of Los Angeles was granted rights to all groundwater in the San Fernando Basin that is derived from precipitation within ULARA. There are a number of production well fields in the eastern SFV, including six LADWP well fields located in or near the NHOU. The output from the existing NHOU remedy accounts for approximately 1 to 2 percent of LADWP's total extraction from the SFV groundwater basin. The need for drinking water development in the eastern SFV, including the NHOU, is expected to increase over the next 20 years as restrictions on importing water to Southern California increase and imported water becomes more expensive. An Interim ROD addressing Operable Unit 4 was completed in September 2009.

Environmental Interest/Information System

California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Background Info:	The San Fernando Valley Ground Water Basin (SFVGWB) is located within the Upper Los Angeles River Area, and consists of the eastern portion of the San Fernando Valley and the entire Verdugo Basin. The SFVGWB encompasses approximately 112,000 acres of alluvial valley fill deposits and provides enough water to serve approximately 600,000 residents. The Basin is bounded on the north and the northwest by the Santa Susana Mountains, on the northeast by the San Gabriel Mountains, on the west by the Simi Hills and on the south by the Santa Monica Mountains. The San Fernando Valley Study area includes four National Priorities List (NPL) sites. They are: Area #1 - North Hollywood NPL Site covers 9336 acres in the eastern part of the San Fernando Valley. The site has been divided into the North Hollywood Operable Unit(OU) and the Burbank OU. Area #2 - Crystal Springs NPL Site covers 3975 acres located southeast of the North Hollywood NPL site and is in the cities of Glendale and Los Angeles. Area #3 - Verdugo NPL Site covers 2673 acres in the eastern part of the SF Valley and is located in and adjacent to La

SAN FERNANDO VALLEY (AREA 1) (Continued) **1000709322**

Crescenta in the Verdugo Mountains.
Area #4 - the Pollock NPL Site covers 1635 acres in the south-eastern part of the San Fernando Valley and is located in and adjacent to the cities of Los Angeles and Glendale.
Groundwater contamination in the SFVGWB is linked to prewar, postwar, and current industrialization in the San Fernando Valley.
The primary contaminants of concern are the volatile organic compounds (VOCs) trichloroethylene (TCE) and tetrachloroethylene (PCE). These compounds have been and/or are being used in many San Fernando Valley industries, such as aeronautical, automotive dry cleaning, and metal plating. These solvents have found their way to the groundwater basin as a result of both past and improper use, storage and disposal practices. The SFVGWB Superfund sites, added to the NPL in 1986, are areas where groundwater from wells have been found to contain VOCs above the state and federal drinking water standards. Groundwater contamination in numerous wells have been so severe with TCE and PCE that these wells have essentially been put out of commission.
Exposure of receptors to contaminants can possibly occur through ingestion of contaminated drinking water, inhalation of VOC vapors released from the contaminated water as in taking showers, and dermal exposure as in washing or bathing. However, with the strict regulatory control over water quality by the State's Department of Health, Office of Drinking Water (ODW), the RWQCB, and other agencies, residents are assured that the water they consume is safe and that no one is drinking water which contains concentrations of contaminants above regulatory standards. Federal, state, and local agencies have been conducting investigations and cleanup of contaminated groundwater in the San Fernando Valley since contamination was discovered in 1979. These activities involve measuring the extent of contamination, developing and implementing cleanup remedies, and identifying responsible parties.
EPA provided oversight of the basinwide Remedial Investigation (RI) of groundwater contamination conducted by the Los Angeles Department of Water and Power (LADWP). The RI objectives were to collect lithological and water quality data and information regarding basin operations for the eastern SF and Verdugo basins; develop a regional characterization of geology, hydrology, hydrogeology and the nature and extent of groundwater contamination within the eastern and Verdugo basins; study fate and transport of compounds in the environment; identify Applicable or Relevant and Appropriate Requirements; (ARAR's) and evaluate the potential risk to human health and the environment.
The Remedial Investigation of the SFVGWB was divided into two phases.
Phase I activities have included vertical profile borings and installation of monitoring wells to obtain preliminary contamination information. Monitoring wells have been installed as follows: 34 in North Hollywood (Area #1); 29 in Crystal Springs (Area #2); 7 in Verdugo (Area #3); and 17 in Pollock (Area #4).
Information obtained from Phase I investigation activities identified the need for several operable units. Operable Unit is a federal term which is similar to the State's definition of a removal action.

SAN FERNANDO VALLEY (AREA 1) (Continued) **1000709322**

Phase II activities consist of a basinwide remedial investigation conducted by the LADWP.
Remedial Actions (RAs):
North Hollywood (Area #1) -- Two RAs were identified for Area #1, the North Hollywood OU and the Burbank OU.
A Record of Decision (ROD) for the North Hollywood RA was signed in September 1987, selecting groundwater extraction and treatment (air stripping) of 2,000 gallons per minute (gpm) of contaminated water as an interim remedy. This RA was constructed with funding from EPA and the State and has been treating contaminated groundwater since March 1989. This facility is located at 11845 Vose Street in the N. Hollywood section of Los Angeles.
A ROD for the Burbank OU was signed in June 1989, again selecting groundwater extraction and treatment of about 12,000 gpm of contaminated water. Phase I of the Burbank OU began operations in January 1996 treating groundwater at a rate of 6,000 gpm. Phase II began operations in May 1998 adding an additional 3,000 gpm to the Burbank OU's treatment capacity.
Crystal Springs (Area #2) -- LADWP has completed a focused RI/FS for this proposed RA. The Glendale OU has been separated into a North OU and a South OU based on the amount of contamination and the facilities contributing to the GW contamination. A ROD for each OU was signed on June 18, 1993 designating groundwater extraction and treatment as the interim remeday. The PRPs have formed a group and combined the RA efforts for each OU into one document. The selected alternative is GW extraction and treatment. The Glendale OU began operations in September 2000.
Verdugo and Pollock (Areas #3 and #4) --
Currently no RAs have been identified for Area #3 or for Area #4. In October 2003 US EPA proposed No Remedial Action for Verdugo Basin (Area #3).
Another contaminant of concern, hexavalent chromium, has been identified in the San Fernando Valley Groundwater Basin.
EPA and the RWQCB are currently dentifying potential sources of contamination and pursuing PRPs that may be responsible for contaminating groundwater. As these PRPs are identified, individual site investigations and mitigation activities will be pursued. Enforceable agreements and orders will be implemented at numerous specific potential source sites within the Basin by RWQCB and DTSC

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: 5 Year Review Reports
Completed Date: 08/17/1998
Comments: A second 5-year review of remedial activities is conducted at the North Hollywood OU (NHOU) and covers operations from 1993 thru 1997. The purpose was to evaluate whether the NH Interim Remedy achieved the objectives specified in the ROD. The findings of the 5-year review are that the objectives of the ROD have been met.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste code: 171
Waste name: 171

Waste code: 792
Waste name: 792

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D007
Waste name: CHROMIUM

Waste code: F006
Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM

AMERICAN ETCHING AND MFG. (Continued) **1000360637**

PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.

AMERICAN ETCHING AND MFG. (Continued) **1000360637**

Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

PRICE PFISTER INC (Continued) **S100942803**

Site History:

Gasoline, Other Petroleum, Waste Oil / Motor / Hydraulic / Lubricating, Polynuclear aromatic hydrocarbons (PAHs)
Price Pfister (PP), and subsequently Black and Decker (B&D), manufactured plumbing fixtures on a 25 acre site in the Pacoima area. This site is located south of another site, Holchem, which is under oversight by DTSC. In preparation for redevelopment as a shopping area, staff has overseen onsite investigations and cleanup, largely through excavation and removal of heavily contaminated soils, soil vapor extraction, and air sparging. As documented in our March 4, 2009 letter, there were two main and other volatile organic compound (VOCs) source areas in Areas 1 through 6 and 8 of the site (See attached Figure 1). One was located in the former Oil Staging Area (OSA in Area 4), and second consisting of the Barron degreaser and the two Delta degreasers was located in the former Building P area (Area 3) of the Price Pfister site. Other VOC source areas included the two sumps and a clarifier in the Plating line in the Building P Area (Area 2), and a sump in the Machine Shop area of the Building P area. As required by the Regional Board, Price Pfister remediated the VOC-contaminated soil in the above two main source areas using soil vapor extraction (SVE), and later excavated and removed the VOC-contaminated soil from several locations. Price Pfister also conducted a site-wide soil gas survey of the site during September 2007. Price Pfister submitted the Human Health Risk Assessment (Final HHRA) for Areas 1 through 5 and 8, Former Price Pfister Site, dated July 23, 2008, and the Final Human Health Risk Assessment for Areas 1 through 5 and 8, Former Price Pfister Site, dated October 2, 2008. At the request of the Regional Board staff, California Department of Toxic Substances Control (DTSC) Human and Ecological Risk Division (HERD) reviewed those reports, and, in their letter dated November 7, 2008, determined that the Final HHRA for Areas 1 through 5 and 8 was acceptable. DTSC-HERD also reviewed the Draft Human Health Risk Assessment for Areas 6 and 7, dated November 13, 2008, and in their comment letter dated January 7, 2009, concurred with the risk assessment methodology and results and listed their future requirements. In addition, in order to confirm that the previous soil vapor extraction operations had removed any residual VOCs in soil matrix, Price Pfister collected soil matrix confirmation samples from the two known VOCs source areas in OSA and Building P degreasers area, submitted the Results of Soil Sampling for Volatile Organic Compounds, Probe Abandonment, and Request for No Further Action for VOCs in Soil 13500 Paxton Street, Pacoima, California dated July 16, 2008. Based on our review of the analytical results, no VOCs were detected above the mobile laboratory reporting limit of 0.0010 mg/kg, which is lower than our approved soil matrix cleanup goal {e.g., 0.060 milligram per kilogram (mg/kg) for both PCE and trichloroethylene (TCE)}. However, PCE concentrations in soil gas samples, collected from monitoring well SVMW-202 (located near the Building P degreaser area) on September 13, 2007 after rebound test (as documented in the report titled Results of Rebound Testing for Soil Vapor Extraction System 13500 Paxton Street, Pacoima, California, dated December 20, 2007), were 1.9 micrograms per liter (a%g/L) at 15 feet below ground surface (bgs), 13 a%g/L at 30 feet bgs, and 20 a%g/L at 45 feet bgs. Similarly, a soil gas sample collected from 30 feet bgs in monitoring well PMW-11 (located adjacent to the former OSA) was reported to contain 3.3 a%g/L and 7.3 a%g/L of PCE, at 15 and 30 feet bgs, respectively. Other significant PCE concentrations detected on September 13, 2007 after the rebound

PRICE PFISTER INC (Continued) **S100942803**

were: 10 a%g/L at 45 feet bgs in monitoring well PMW-9, 15 a%g/L at 60 feet bgs in monitoring well PMW-13, and 7.9 a%g/L at 59 feet bgs in monitoring well SVMW-226. Staff believes that the decreasing concentration trend toward ground surface indicates probable offgasing of PCE from the underlying dissolved VOCs groundwater plume. Therefore, in order to remove any PCE offgasing from the onsite and offsite VOC groundwater plume, staff has determined that it was necessary to continue operating the SVE well PSVE-10 in Area 6 until the PCE concentrations in the plume are stabilized as close as possible to the PCE maximum contaminant level (MCL) of 5a%g/L, and also to continue semi-annual monitoring of VOCs in soil vapor from the multi-depth soil vapor monitoring well SVMW-226. Based on the information provided in your reports on Areas 1 through 6 and 8 of the site for our review, and with the provision that the information provided to Regional Board staff was accurate and representative of the site conditions, and based on acceptance of the Final HHRA for Areas 1 through 5 and 8 by DTSC-HERD, we approved a no further action for VOCs in soil in all the reported, investigated, and remediated source areas in Areas 1 through 6 and 8 of the former Price Pfister site overseen by the Regional Board staff, subject to compliance with the following conditions: 1. Price Pfister shall continue the semi-annual groundwater monitoring of their onsite and offsite VOCs and TPH plumes using all the Regional Board-required groundwater monitoring wells until approved cleanup goals are achieved and maintained thereafter for a period of one year. 2. Price Pfister shall continue the quarterly groundwater monitoring of their onsite and offsite hexavalent chromium and 1,4-dioxane groundwater plumes using all the Regional Board-required wells used for delineation of the plumes until groundwater cleanup goals are achieved through implementation of a Regional Board-approved remedial action plan and maintained thereafter for a period of one year. 3. Price Pfister shall continue to monitor multi-depth soil vapor well SVMW-226, and other DTSC-required multi-depth soil gas probes in Area 6, and shall continue operating the SVE well PSVE-10 using its connection to the Area 7 SVE system, until the PCE concentrations in the underlying VOC groundwater plume are stabilized as close as possible to the PCE maximum contaminant level (MCL) of 5a%g/L and remain at that stable concentration for a period of one year. 4. Price Pfister shall continue to comply with the deed restriction recorded for the site to limit future land uses to industrial/commercial purposes and to prohibit groundwater use. 5. Price Pfister shall continue to implement our requirements as stated in all our directives until site closure is obtained. If, in future, any uninvestigated contaminant source areas resulting from former Price Pfister operations are discovered at the site, Regional Board will hold Black & Decker (or Price Pfister) or the current property owner, legally liable and responsible for conducting and completing any site investigations and cleanup of such remaining contaminant source areas as required by the Regional Board. Removal of free hydrocarbon product and remediation of TPH (mostly C12 to C44) and VOCs contaminated soil and underlying groundwater in the Former Building A Area (approxim. 300 feet long, 200 feet wide, and 66 feet deep) included in Area 7 still remains to be completed, and PP has selected bioventing as the soil remediation technology. In our November 25, 2009 13267 Order, Regional Board required PP to submit a revised Workplan for Area 7 Bench Scale Tests by December 30, 2009, a Technical Demonstration Report (i.e., microbial evaluation report) by December 30, 2009, and a Field Pilot

PRICE PFISTER INC (Continued) **S100942803**

Test Workplan (a technical report) to perform a field pilot test by March 15, 2010. During the December 14, 2009 meeting with the representatives of Price Pfister, Price Pfister requested Regional Board staff to consider the rescission of the November 25, 2009 requirements for the submittal of the above technical reports because, as presented by Price Pfisters expert consultants at the meeting, bioventing is a well demonstrated soil bioremediation technology for petroleum hydrocarbons, and Area 7 is suitable for bioventing based on a respirometry field test conducted in 2008. It was also agreed at the meeting that site specific bioventing design parameters would need to be developed and evaluated to ensure effectiveness of bioventing as the selected remedial technology. Based on our agreement at the December 14, 2009 meeting, the November 25, 2009 13267 Order was rescinded and replaced with the requirements below, issued under California Water Code 13267 Order. As we discussed at the December 14, 2009 meeting, PP agreed and is required to submit a full-scale bioventing design report for Area 7 as described below. By March 15, 2010, PP is required to submit a full-scale bioventing design report for Area 7 for our review and approval. The design report shall demonstrate adequate delivery of oxygen for effective remediation of Area 7 by using bioventing technology. The report shall include detailed plots, analysis, interpretation of the laboratory and field data, design parameters (including but not limited to the radius of influence, design flow rate, remedial well spacing), and remedial progress evaluation plan. PP has submitted the Design Report for In-Situ Bioventing to the Regional Board for review.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.

Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Hazardous Waste Summary:

Waste code: 171
Waste name: 171

Waste code: F006
Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste code: F006
Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D006
Waste name: CADMIUM

Waste code: D007
Waste name: CHROMIUM

Waste code: F006

BURBANK PLATING SERVICES CORPORATION (Continued) **1000161742**

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

Waste Type2: Not reported
Waste2: Stormwater Runoff
Primary Waste Type: Nonhazardous Solid Wastes/Influent or Solid Wastes that contain nonhazardous putrescible and non putrescible solid, semisolid, and liquid wastes (E.G., garbage, trash, refuse, paper, demolition and

BURBANK PLATING SERVICES CORPORATION (Continued) **1000161742**

construction wastes, manure, vegetable or animal solid and semisolid waste).
Secondary Waste: Not reported
Secondary Waste Type: Not reported
Design Flow: 0
Baseline Flow: 0
Reclamation: No reclamation requirements associated with this facility.
POTW: The facility is not a POTW.
Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Alternate Address:	13546 DESMOND STREET
Alternate City,St,Zip:	PACOIMA, CA 91331
Background Info:	Prior to July 1, 1987 the Site was operated by Chase Chemical under the ownership of Herman Benjamin. As of that date the Site was operated by Holchem, Inc under a lease from Herman Benjamin. The Site operates as a chemical distributer. The facility property occupies about 2 acres in an industrial/ residential area. There are 2 buildings, one for offices and packaging and the other for warehousing hazardous substances. The facility uses 23 AGSTs, 19 UGSTs, 1 clarifier for a drum rinse area, 2 sumps for rainwater runoff, and a 55 gal drum storage area able to contain 300 drums. The property is completely paved and fenced.
	Not reported
	The site was originally overseen by the RWQCB. Semi-annual GW monitoring had been conducted since Sept 92. RWQCB had no funds to work on the site, it was then referred to DTSC under the USEPA PA/SI program. DTSC then determined that an I&SE Order be issued to expedite the evaluation, containment and cleanup of the site. The site is of special concern because a few miles downgradient exist 2 of LADWP's main drinking water wellfields.
Comments Date:	01032002
Comments:	Off-site drilling (3 wells) was completed. The three wells
Comments Date:	01032002

Comments: The draft report has been complete.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Technical Report
Completed Date: 05/05/2005
Comments: DTSC considered the draft contained all necessary data.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 02/23/2011
Comments: DTSC needed more information.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 07/26/2011
Comments: DTSC determines the First Quarter 2011 Groundwater Monitoring Report, dated April 30, 20ll does not require revision, and consider final.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 10/04/2011
Comments: DTSC determines that the Second Quarter 2011 Groundwater Monitoring Report dated July 29,2011 does not require revision.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Characterization Workplan
Completed Date: 09/20/2011
Comments: DTSC dtermines the document (Workplan) dated July 29, 2011 does not require revision.

HOLCHEM INCORPORATED (Continued) **1000170315**

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 01/24/2012
Comments: DTSC determines that the Third Quarter 2011 Groundwater Monitoring Report, dated October 30,2011 does not require revision.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 03/08/2012
Comments: DTSC determines that the 4th Quarter 2011 Groundwater Monitoring Report dated January 31, 2012 does not require revision and approves the report.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Characterization Report
Completed Date: 08/07/2012
Comments: Report dated June 28,2012 requires no revision.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 05/29/2012
Comments: DTSC reviewd The First Quarter 2012 Groundwater Monitoring Report dated April 26, 2012, and determines does not require revisions.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 09/11/2012
Comments: The Second Quarter 2012 Groundwater Monitoring Report, dated July 31, 2012 does not require revision.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 01/17/2013
Comments: Document accepted as final if comments are noted in subsequent monitoring report.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 04/30/2013
Comments: Review of the Fourth Quarter 2012 GW monitoring report completed 4/30/2013

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 11/26/2013
Comments: The first quarter 2013 groundwater monitoring report comment letter was completed on 11/26/2013

Completed Area Name: PROJECT WIDE

HOLCHEM INCORPORATED (Continued) **1000170315**

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 09/29/2014

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 09/29/2014
Date Data Arrived at EDR: 10/08/2014
Date Made Active in Reports: 11/17/2014

Next Scheduled EDR Contact: 04/20/2015
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 09/29/2014

Next Scheduled EDR Contact: 04/20/2015
Data Release Frequency: Quarterly

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 10/25/2013
Date Data Arrived at EDR: 11/11/2013
Date Made Active in Reports: 02/13/2014

Data Release Frequency: Varies

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 06/10/2014

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Data Release Frequency: Quarterly

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 07/25/2014
Date Data Arrived at EDR: 09/09/2014

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)
The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

2020 COR ACTION: 2020 Corrective Action Program List
The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR US Hist Auto Stat: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 07/30/2013
Date Data Arrived at EDR: 08/19/2013
Date Made Active in Reports: 10/03/2013

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

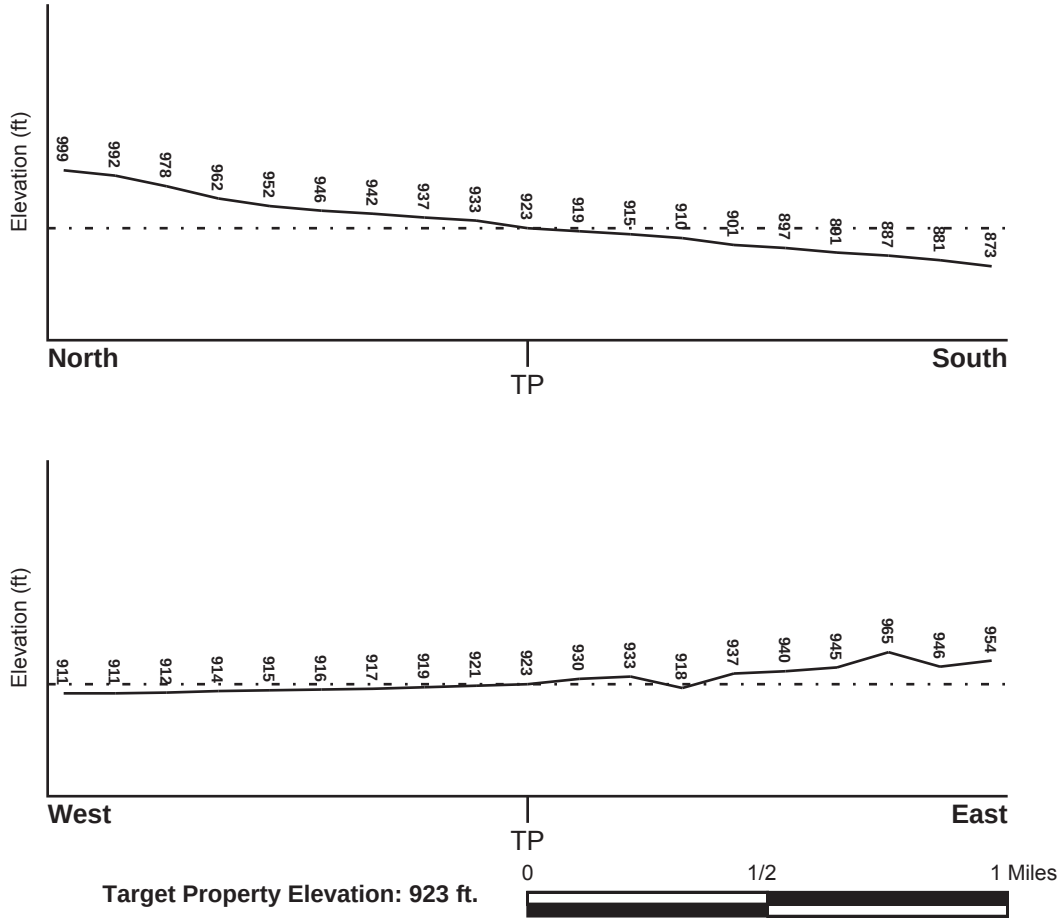
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
LOS ANGELES, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 06037C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
NOT AVAILABLE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Xerorthents

Soil Surface Texture: variable

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	59 inches	variable	Not reported	Not reported	Max: Min:	Max: Min:
2	59 inches	64 inches	unweathered bedrock	Not reported	Not reported	Max: Min:	Max: Min:

Soil Map ID: 2

Soil Component Name: Capistrano

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	40 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 6.1
2	40 inches	72 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 8.4 Min: 6.6

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

February 8, 2015

Project Name: Pacoima

Geosyntec Consultants
2100 Main Street, Suite 150
Huntington Beach, CA 92648

Attention: Zahra Amini

Dear Ms. Amini

Attached is the Environmental (Hazardous/Toxic Waste) Records Search Summary of the "Pacoima Spreading Grounds" located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street & Arleta Avenue and 10450 Arleta Avenue ("Pacoima") site located in Pacoima, California. Environmental Support Services ("**ESS**") received the request on January 16, 2015 and January 23, 2015 (See Appendix A). Should you have any questions regarding the summary, please call.

Sincerely,
Environmental Support Services

Shannon Castagno
Project Manager
Shannon@EnvironmentalSupportServices.com

Records Search Summary

Company:	Geosyntec Consultants
Project Name:	Pacoima
Attention:	Zahra Amini
Street Address of Property:	"Pacoima Spreading Grounds" Located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street and Arleta Avenue 10450 Arleta Avenue Pacoima, CA APN's 2647-015-900, 2648-012-905, 2648-012-904, 2647-015-901, 2617-014-905 & 2617-014-904

Los Angeles County – Public Health Investigator

Faxed request: 1-16-15 & 1-23-15, Contact: Samuel Kaddis

ESS submitted a request for a records search concerning the Pacoima site to Mr. Kaddis, a Public Health Investigator for Los Angeles County (See Appendix B). **ESS** requested information concerning the utilization, manufacture, storage and/or discharge of hazardous materials/waste, and any information concerning previous or on-going site investigations/remediations pertaining to hazardous materials/waste. Thomas Nguyen, a Deputy Health Officer with the County, informed **ESS** on January 27, 2015 that his department had no records for 10450 Arleta Avenue, Pacoima, CA (See Appendix B).

Department of Toxic Substances Control (DTSC) – Cypress Office

Faxed request: 1-16-15 & 1-23-15, Contact: Julie Johnson/Jone Barrio

Previous contacts with the DTSC have disclosed that this office only collects and stores information (such as treatment, storage and disposal of hazardous waste) concerning sites which have existing businesses, industries, etc. present. **ESS** requested that Ms. Johnson/Ms. Barrio, with the DTSC, check the file room records for any files/information concerning "Pacoima Spreading Grounds" located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street & Arleta Avenue and 10450 Arleta Avenue, Pacoima, CA, APN's 2647-015-900, 2648-012-905, 2648-012-904, 2647-015-901, 2617-014-905 & 2617-014-904 (See Appendix C). Ms. Barrio informed **ESS** on January 27, 2015 that her department had no records for 10450 Arleta Avenue, Pacoima, CA (See Appendix C).

Department of Toxic Substances Control (DTSC) – Chatsworth Office

Faxed request: 1-16-15 & 1-23-15, Contact: Vivian Tutaan

Previous contacts with the DTSC have disclosed that this office only collects and stores information (such as treatment, storage and disposal of hazardous waste) concerning sites which have existing businesses, industries, etc. present. **ESS** requested that Ms. Tutaan, with the DTSC, check the file room records for any files/information concerning "Pacoima Spreading Grounds" located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street & Arleta Avenue and 10450 Arleta Avenue, Pacoima, CA, APN's 2647-015-900, 2648-012-905, 2648-012-904, 2647-015-901, 2617-014-905 & 2617-014-904 (See Appendix D). Glenn Castillo, with that department informed **ESS** on January 30, 2015 that his department had no records for 10450 Arleta Avenue, Pacoima, CA (See Appendix D).

City of Los Angeles Fire Department (Central) – Haz Mat Division

Faxed request: 1-16-15 & 1-23-15, Contact: Kacy Williams

ESS requested that Ms. Williams, with the City of Los Angeles Fire Dept., check her records concerning the storage of hazardous materials/waste with regards to the following: "Pacoima Spreading Grounds" located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street & Arleta Avenue and 10450 Arleta Avenue, Pacoima, CA, APN's 2647-015-900, 2648-012-905, 2648-012-904, 2647-015-901, 2617-014-905 & 2617-014-904. Sharon Dooley, with that department informed **ESS** on February 5, 2015 that her department only had records 10450 Arleta Avenue, Pacoima, CA (See Appendix E).

City of Los Angeles Fire Department (Central) – Plan Check/UG Tank Div

Faxed request: 1-16-15 & 1-23-15, Contact: Katie Rosa

ESS requested that Ms. Rosa, with the City of Los Angeles Fire Dept., check her records concerning the storage of hazardous materials/waste and underground storage tanks with regards to the following: "Pacoima Spreading Grounds" located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street & Arleta Avenue and 10450 Arleta Avenue, Pacoima, CA, APN's 2647-015-900, 2648-012-905, 2648-012-904, 2647-015-901, 2617-014-905 & 2617-014-904. As of February 8, 2015, Ms. Rosa had not completed **ESS'** request. Should any information concerning the site surface, **ESS** will immediately forward it to Ms. Amini at the Geosyntec Consultants office.

City of Los Angeles Fire Department (Central) – Ind/Comm Division

Visited: 1-20-15 & 1-28-15, Contact: Mina

ESS requested that Mina, with the City of Los Angeles Fire Dept., check her records concerning the storage of hazardous materials/waste and underground storage tanks with regards to the following: "Pacoima Spreading Grounds" located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street & Arleta Avenue and 10450 Arleta Avenue, Pacoima, CA, APN's 2647-015-900, 2648-012-905, 2648-012-904, 2647-015-901, 2617-014-905 & 2617-014-904. She informed **ESS** that her department had no files for that site.

City of Los Angeles Public Works – Industrial Waste

Faxed request: 1-16-15 & 1-23-15, Contact: Dennis Acevedo

ESS requested that Mr. Acevedo, with the City of Los Angeles Public Works Department, check his records for any information concerning industrial waste discharge permits or violations for "Pacoima Spreading Grounds" located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street & Arleta Avenue and 10450 Arleta Avenue, Pacoima, CA, APN's 2647-015-900, 2648-012-905, 2648-012-904, 2647-015-901, 2617-014-905 & 2617-014-904 (See Appendix F). Bellete Yohannes, with that department informed **ESS** on January 27, 2015 that his department had no records for 10450 Arleta Avenue, Pacoima, CA (See Appendix F).

City of Los Angeles Building Department

Visited: 1-20-15 & 1-28-15, Contact: Maria & Ramona

ESS requested that Maria & Ramona, with the City of Los Angeles Building Department, provide the building records (all building permits and certificates of occupancy) for "Pacoima Spreading Grounds" located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street & Arleta Avenue and 10450 Arleta Avenue, Pacoima, CA, APN's 2647-015-900, 2648-012-905, 2648-012-904, 2647-015-901, 2617-014-905 & 2617-014-904. They informed **ESS** they had no building records for that site. The City of Los Angeles Building records date back to the year 1905. No further information concerning the site was obtained from the building department at the time of the investigation.

South Coast Air Quality Management District (SCAQMD)

E-mailed request: 1-16-15 & 1-23-15, Contact: Linda Koenig

Previous communications with Personnel of the SCAQMD have disclosed that records concerning active, inactive and sold files can be obtained online. **ESS** searched the SCAQMD web site and no found records for "Pacoima Spreading Grounds" located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street & Arleta Avenue and 10450 Arleta Avenue, Pacoima, CA, APN's 2647-015-900, 2648-012-905, 2648-012-904, 2647-015-901, 2617-014-905 & 2617-014-904. **ESS** also submitted a search request concerning active, inactive and sold files concerning the Pacoima site to Ms. Koenig of Public Records at the SCAQMD (See Appendix G). Elizabeth Gonzalez, with that department informed **ESS** on January 30, 2015 that her department had no records for 10450 Arleta Avenue, Pacoima, CA (See Appendix G).

Regional Water Quality Control Board (RWQCB) – Los Angeles Region

E-mailed request: 1-16-15 & 1-23-15, Contact: Laura Gallardo

ESS requested that Ms. Gallardo, with the RWQCB, provide the files for "Pacoima Spreading Grounds" located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street & Arleta Avenue and 10450 Arleta Avenue, Pacoima, CA, APN's 2647-015-900, 2648-012-905, 2648-012-904, 2647-015-901, 2617-014-905 & 2617-014-904 (See Appendix H). Rosie Villar, with that department, informed **ESS** on January 26, 2015 & February 2, 2015 that her department had no records for the Pacoima site (See Appendix H).

Subject: Pacoima Spreading Grounds

Hi Shannon,

We got a hold of a previous report for the site: “Pacoima Spreading Grounds” that indicates a street address for the site as the following:

10450 Arleta Avenue
Pacoima, California

I was wondering if you could apply this new information to the request to the regulatory agencies for relevant documents. I would appreciate it if you could let me know of the associated costs in advance.

Many thanks,

Zahra

Attachments: Site Figures.pdf; Site Location.pdf

Hi Shannon,

It was great speaking with you earlier today. I would like to ask you to please provide us with your services regarding environmental records for the site described below. We are interested in your full package that includes building, fire, and environmental health agencies in addition to Sanitation, DTSC, AQMD, Regional Board and etc for $350. As I mentioned before please note that this is a fairly quick turnaround job for us.

Site name: Pacoima Spreading Grounds

Los Angeles County Flood Control District's (LACFCD) Spreading Ground Site is located in the northern portion of the San Fernando Valley immediately west of the Pacoima Diversion Channel and near the intersection of Devonshire Street and Arleta Avenue.

I have attached some figures to this email for more information regarding site location. Please do not hesitate to contact me if you have any questions.

Thank you very much and best regards,

Zahra

Dear Custodian of Records,

Environmental Support Services (ESS) is in the process of conducting a records search for an environmental audit at a site in Pacoima, CA. This search includes researching the history of the site, especially as it pertains to hazardous materials/waste. With this in mind, **ESS** requests the following information concerning the subject address which your agency may have on file:

1. any unauthorized releases, utilization, manufacture, storage, or discharge of hazardous materials/waste.

2. previous or on-going site investigations/remediations pertaining to hazardous materials/waste.

Should you have any questions concerning this request for information, please call. Your expedient processing of this request is appreciated.

Sincerely,
Environmental Support Services

Pacoima, CA 91331

Dear Custodian of Records,

Environmental Support Services (ESS) is in the process of conducting a records search for an environmental audit at a site in Pacoima, CA. This search includes researching the history of the site, especially as it pertains to hazardous materials/waste. With this in mind, **ESS** requests the following information concerning the subject address which your agency may have on file:

1. any unauthorized releases, utilization, manufacture, storage, or discharge of hazardous materials/waste.

2. previous or on-going site investigations/remediations pertaining to hazardous materials/waste.

Should you have any questions concerning this request for information, please call. Your expedient processing of this request is appreciated.

Sincerely,
Environmental Support Services

Subject: Phase II Environmental Site Assessment
Pacoima Spreading Grounds Headworks
Los Angeles, California

Dear Ms. Starbird:

This letter report presents the results of soil and soil vapor sampling and testing conducted at the Pacoima Spreading Grounds headworks property (the Site) of the Los Angeles County Flood Control District (LACFCD), located at 10450 Arleta Avenue, Pacoima, California [Figure 1]. This Report was prepared by Dr. Zahra Amini of Geosyntec Consultants (Geosyntec), and reviewed by Mr. Eric Smalstig, P.E., also of Geosyntec, in accordance with the internal peer review policy of the firm. Geosyntec has prepared this letter report to support the California Environmental Quality Act (CEQA) process for a basin enhancement project at the Site.

PROJECT DESCRIPTION AND PURPOSE

LACFCD is performing a basin enhancement project (Project) at the Pacoima Spreading Grounds. The Project is subject to the CEQA process. To support the planning and CEQA process for the Project, Geosyntec completed a Phase I Environmental Site Assessment (ESA) of the property [Geosyntec, 2015]. During the completion of the Phase I Environmental Site Assessment (ESA) of the Site [Geosyntec, 2015], Recognized Environmental Conditions (RECs) were identified at the Site pursuant to American Society of Testing of Materials (ASTM) guidance. Therefore, LACFCD requested that a Phase II ESA, consisting of Site environmental sample collection and testing, be performed to further assess the Site RECs in the headworks area.

The Phase I ESA revealed evidence of the following RECs, and associated potential sources of impact, in connection with the Site:

- The closed San Fernando City Landfill and the oil and gas wells located adjacent to the Site (northeast of the Site) are potential sources of gas migration to the Site;

- The underground storage tanks (UST) that were located on-Site at 10450 Arleta Avenue (removed from the Site several years ago); and

- The waste materials / paint storage areas and general petroleum hydrocarbon impacts that were detected in soil samples during previous subsurface investigations at the Site.

Accordingly seven locations were identified for soil and soil vapor sampling at the Site. These locations are shown in Figure 2 in relation with the areas of potential concern. The scope of work for this Phase II ESA was to collect soil and soil vapor samples and perform chemical testing on those samples to further evaluate the above listed potential impacts at the Site. The scope of work did not include evaluation of the spreading basins. The field activities and associated results are described in this letter report.

SITE BACKGROUND

The Site is located at 10450 Arleta Avenue in Pacoima, California, north of the intersection of Arleta Avenue and Paxton Street, in the northern portion of the San Fernando Valley [Figure 1]. The Site is bordered by Paxton Street to the southeast, Pacoima Diversion Channel to the east, Arleta Avenue to the southwest, and a fenceline that separates the Site from the residential areas to the west and north of the headworks.

Pacoima Spreading Grounds has been serving as a drainage/flood control feature, and later a spreading grounds, since at least 1952. The water is diverted from the Pacoima Diversion Channel using the radial gate located in the channel adjacent to the headworks at the Site. The water then flows over a weir, through the intake canal, passing through pipes under Arleta Avenue to the spreading basins. The water percolates into the groundwater basin at the spreading grounds. The Site (i.e., headworks area) is trapezoidal with total lot size of approximately 8 acres and is comprised of multiple structures, including a hazardous materials storage area with storage units [Figure2]. A subsurface ESA was conducted at the Site in 2003 [Kleinfelder, 2003]. A summary of the Phase II ESA follows:

- This assessment included the drilling of 30 borings and the collection of 40 soil samples for laboratory testing at the Site.

- The soil samples were analyzed for total petroleum hydrocarbons (gasoline, and diesel range), volatile organic compounds (VOCs), total recoverable petroleum hydrocarbons (TPH), organochlorine pesticides, polychlorinated biphenyls (PCBs), California Title 22 metals, and chlorinated herbicides.

- VOCs, PCBs, herbicides and pesticides were not detected in soil samples.

- Hydrocarbons were detected at concentrations ranging from 1.36 to 85.4 milligrams per kilogram (mg/kg). Petroleum hydrocarbons in soil were not vertically delineated.

- With the exception of lead, concentrations of detected metals were below the U.S. EPA Residential Preliminary Remediation Goals (PRGs); note that PRGs are currently referred to as Regional Screening Levels (RSLs). Lead was detected in one sample at 5 ft below ground surface (bgs) at a concentration of 155 milligram per kilogram (mg/kg). Based on this result the Waste Extraction Test (WET) was performed resulting in a concentration of 9.11 milligrams per liter (mg/L). This concentration is greater than the Soluble Threshold Limit Concentration (STLC) used for hazardous waste classification.

- A soil gas survey was also recommended depending on the future uses of the Site.

In 2011, an underground tank was removed from the headworks area pursuant to a removal permit granted by the Los Angeles City Fire Department [Figure 2]. Subsequently, a closure report dated 31 October 2011 was submitted to the Fire Department which resulted in a "No Further Action" from the Fire Department. The closure report indicated that the tank had no documented releases and no significant concentrations of hydrocarbon associated with the tank were found in the surrounding soils.

FIELD ACTIVITIES

General

The field activities associated with this Phase II Site assessment were conducted in general accordance with Geosyntec's Scope of Work dated July 2014 and a Site-specific Health and Safety Plan (HASP). Field activities included the drilling of soil

borings, collection of soil samples and installation of soil vapor probes were conducted on August 20, 2015. Soil vapor samples were collected in Summa canisters on August 26, 2015. Soil and soil vapor quality at the Site were assessed by drilling and sampling 7 soil borings (SV-1, S-2, S-3, S-4, S-5, S-6, and SV-7). A single-depth soil vapor probe was installed at each of the two SV-1 and SV-7 locations.

Field Work Preparation

The boring locations were marked on August 14, 2015. Geosyntec contracted Goldak, a utility locating firm, to conduct a subsurface geophysical survey on August 14, 2014, to identify locations of potential underground utilities and clear boring locations. Underground Service Alert (USA) was notified more than 48 hours prior to beginning drilling activities to identify and mark underground utilities in the vicinity of the proposed borehole locations. As an added precaution, boring locations were also cleared by hand-auger to depths of approximately 5 ft bgs.

Soil Borings and Sampling

On 20 August 2015, seven soil boring location (SV-1, S-2, S-3, S-4, S-5, S-6, and SV-7), were advanced to a total depth of 10 ft bgs at the locations shown in Figure 2. At each boring location, a subcontractor, Interphase Environmental Inc. (Interphase) first cored through the asphalt or concrete (as applicable) prior to hand augering to depths of approximately 5 ft bgs. Following hand augering, borings were advanced using a truck-mounted direct-push drill rig (Geoprobe® 6600) to the target depths. A continuous soil core was collected from each of the seven boring locations and visually logged for lithology in accordance with the Unified Soil Classification System (USCS) by the onsite Geosyntec representative. In addition, the soil core was screened for evidence of VOC impacts using a photoionization detector (PID). Soils underneath the Site were generally found to be silty sand, silt, and sand with gravel. Copies of the boring logs are included in Appendix A.

A total of twenty eight (28) soil samples (four from each boring) were collected at four depths of approximately 1, 3, 7 and 10 ft bgs in laboratory-supplied glass jars sealed with Teflon®-lined plastic caps for analysis of TPH and California Title 22 Metals. Each jar soil sample from approximately 1 and 10 ft bgs was accompanied with a Terra Core sample. Soil samples from 3 and 7 ft bgs were collected to be retained for laboratory testing as a contingency, based on the results from the 1 ft and 10 ft samples. Following collection, each soil sample was labeled, double-bagged in one-gallon plastic bags, and placed in an insulated cooler with ice for transport to the laboratory under

chain of custody protocols. Soil samples were submitted to Eurofins Calscience Environmental Laboratories, Inc. (Eurofins Calscience), a National Environmental Laboratory Accreditation Conference (NELAC) accredited laboratory, for analyses of TPH by EPA Method 8015B (M), Title 22 metals by EPA Method 6010B/7471A, and for soluble metals by EPA Method 6020 STLC ICP/MS and Method 6010B STLC ICP.

The non-dedicated soil sampling equipment (e.g., direct-push rods and tips, hand augers, etc.) was decontaminated between borehole locations using the "three-bucket-wash" method. Sampling equipment was first washed in a solution of Alconox and potable water, then rinsed with potable water, and finally rinsed with distilled water and allowed to air-dry.

The soil analytical results for Title 22 metals, soluble lead and TPH are presented in Tables 1 through 3 and are discussed under "Results". Soil analytical laboratory results for metals, soluble lead and TPH are provided in Appendix B-1.

Soil Vapor Probe Installation and Sampling

Following direct push drilling of soil borings, soil vapor probes were installed at a single depth of 10 ft bgs at locations SV-1 and SV-7 [Figure 2].

Soil vapor probes were installed using prefabricated six-inch long polyethylene screens set at the target depth. The polyethylene vapor probe screens were attached to 0.25-inch diameter Nylaflow® tubing and lowered down the borings to the target depths. Approximately one foot of medium grained filter sand (#3) was placed around the soil vapor probe screens. Alternating combinations of dry and hydrated bentonite were then used to seal remaining borehole voids between the soil vapor screens and the remainder of the borehole to ground surface. The upper ends of the Nylaflow® tubing were sealed with 0.25-inch two-way valves. Soil vapor probes were completed with 5-inch diameter, flush mounted covers.

No sooner than 48-hours following probe installation, soil vapor samples were collected on 26 August 2015 in Summa canisters. The soil vapor samples were analyzed in the lab by Eurofins Calscience for VOCs by EPA Method TO-15 and fixed gases by ASTM method D-1946.

During sampling, a leak check compound (helium gas) was used to fill (or "charge") a hood that was placed over the wellhead to act as a tracer compound to monitor for

surface air leaks during sampling. Tracer compound analytical results indicated that ambient intrusion of surface gases did not impact the representativeness of the samples.

The VOC analytical results of the soil vapor sampling activities are presented in Table 4 and are presented in the following section. Soil vapor laboratory analytical reports are provided in Appendix B-2.

RESULTS

Introduction

The detectable laboratory analytical results for the soil and soil vapor are summarized in Tables 1 (soil total metals), 2 (soil soluble metals), 3 (soil TPH), and 4 (soil vapor VOCs and fixed gases). The laboratory analytical reports are included in Appendix B. The analytical results are summarized in the following sub-sections by media.

A continuous soil core was collected from each of the seven boring locations and visually logged for lithology in accordance with the Unified Soil Classification System (USCS) by the onsite field engineer. Borings were advanced to a depth of approximately10 ft bgs. Boring logs depicting soil conditions encountered with depth are presented in Appendix A. Soils beneath the Site consist of interbedded layers of sand and silt, with some gravel. In general, soils in the upper 5 feet were found to consist of silty sand, sandy silt and silt with some gravel. At depths of 5 to 10 feet, the subsurface materials mostly contain sand with gravel and silty sand.

Investigation derived wastes (IDW), which included soil cores recovered from each boring, but not selected for laboratory analysis, as well as decontamination fluids, were stored on-Site in a labeled 55-gallon drum, pending laboratory analysis. Based on the results presented later in this section, LACDPW will be managing the IDW along with other soils to be handled in the headworks area.

Soil Sampling Results

A total of 18 soil samples were analyzed from the seven (7) soil borings. Initially fourteen (14) samples were analyzed for TPH by EPA Method 8015B (M) and Title 22 metals by EPA Method 6010B/7471A from depths of approximately 1 and 10 ft bgs. More testing was performed subsequently based on the results of the initial testing. Field observations of recovered soil cores did not indicate significant staining or odors. The following sections present the results of the analyses.

Geosyntec consultants

Total Petroleum Hydrocarbon (TPH)

TPH was analyzed for gasoline, diesel and motor oil ranges and the results are summarized in Table 3. The results of TPH analysis on fourteen (14) soil samples show non-detect concentrations in the C_4-C_{10} carbon range (gasoline). TPH concentrations in the C_{10}-C_{22} carbon range (diesel) and in the C_{22}-C_{32} carbon range (motor oil) were not detected in any of the soils samples except for SV-1, S-2, and S-3 at approximately 1 ft bgs. The detected concentrations of TPH are below the action levels (i.e., 100-10,000 mg/kg for diesel range and motor oil range).

Title 22 Metals

Soil analytical results for Title 22 metals are summarized in Table 1. Table 1 also includes the U.S. EPA, Region 9 Screening Levels (RSLs) for industrial and residential soils for comparison [U.S. EPA, 2014]. The California Code of Regulations Title 22 regulatory thresholds for metals characterization as hazardous materials, Total Threshold Limit Concentration (TTLC) and Soluble Threshold Limit Concentration (STLC), as well as the general guideline for performing soluble analytical testing (10 times STLC levels) are included in Table 1 as well.

As listed in Table 1, Title 22 metals were detected in soil samples collected from borings SV-1, S-2, S-3, S-4, S-5, S-6, and SV-7. Barium, beryllium, cadmium, chromium, cobalt, copper, molybdenum, nickel, vanadium, and zinc were detected in soil samples. However, the detected concentrations of these metals were below EPA RSLs for industrial and residential land use. Arsenic was detected at concentrations above the EPA RSLs for residential land use in the soil samples collected at a depth of 1 ft bgs at location S-4 and lead concentrations of higher than the EPA RSLs for residential were found at 1.5 ft bgs at S-3.

Although detected arsenic concentrations exceed the RSLs for residential soil, detected arsenic concentrations in soil samples are within Southern California background. The DTSC website document: "Evaluation of Arsenic as a Chemical of Potential Concern at Proposed School Sites in the Los Angeles Area (not dated)" reports the 95% Upper Confidence Limit of the 99th percentile concentration ($C_{UL0.95(X0.99)}$) for arsenic in Los Angeles Unified School District as 11.3 mg/kg and states that: "If all the onsite samples are less than the $C_{UL0.95(X0.99)}$ then arsenic can be eliminated as a chemical of potential concern at the site." The highest reported arsenic concentration in the soil samples analyzed from the Site is 1.35 mg/kg.

Analytical laboratory results for total metals also showed total lead concentrations of higher than 10 times STLC in SV-1, S-2, S-3 and S-6 samples conducted at a depth of approximately 1 ft bgs. Subsequently the Waste Extraction Test (WET) analysis was performed on these samples using EPA Method 6010B STLC ICP and 6020 STLC ICP/MS. The WET analysis resulted in lead concentrations of higher than the STLC action level (i.e., 5 mg/l) only in samples conducted from approximately 1 ft bgs at locations S-2 and S-3. To further delineate the vertical extent of lead concentrations, soil samples collected at depths of 3 and 7 ft bgs at S-2 and S-3 locations were analyzed for both total and soluble lead. The S-2 and S-3 samples collected at 3 ft bgs showed lead concentrations of higher than STLC action level (i.e., 5 mg/l) whereas S-2 and S-3 samples collected at 7 ft bgs did not show lead concentrations of higher than the STLC action level [Table 2].

With the exception of arsenic and lead, the laboratory metals results were either: (i) not detected at concentrations above laboratory reporting limits; or (ii) reported at concentrations above laboratory reporting limits but below their respective industrial and residential RSLs, TTLCs and 10 times STLCs.

Soil Vapor Sampling Results

Two soil vapor samples were collected from soil vapor probes installed at 10 ft bgs at soil boring locations SV-1 and SV-7. Soil vapor samples were collected in Summa canisters and were analyzed by Eurofins Calscience laboratory for VOCs using EPA Method TO-15 and for fixed gases using ASTM Method D-1946. Table 4 summarizes the soil vapor VOC and fixed gases analytical results.

As listed in Table 4, a total of thirteen VOCs were detected in soil vapor samples, including acetone, benzene, 2-butanone, 1,4-dichlorobenzene, dichlorodifluoromethane, ethylbenzene, 4-ethyltoluene, tetrachloroethene, toluene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, o-xylene, and p/m-xylene. The number of detected VOCs and also the VOC concentrations (with the only exception of 1,4-Dichlorobenzene) at SV-1 are higher than those at SV-7. The VOCs were detected at microgram per cubic meter (ug/m3) levels, below industrial guidance thresholds (e.g., California Human Health Screening Levels).

Also as listed in Table 4, three fixed gases were detected in soil vapor samples, inducing carbon dioxide, oxygen (+argon) and nitrogen. Similar concentrations of these gases were detected during field monitoring of sample collection at SV-1 and SV-7. Methane was not detected at the sampling locations.

Geosyntec consultants

SUMMARY AND CONCLUSIONS

An assessment of soil and soil vapor was conducted at the Site to assess potential impacts related to the areas of potential concern. Areas of potential concern are related to historical and current uses of the Site and included:

- The closed San Fernando City Landfill and the oil and gas wells located adjacent to the Site (northeast of the Site) are potential sources of gas migration to the Site;
- The underground storage tanks (UST) that were located on-Site at 10450 Arleta Avenue; and
- Petroleum hydrocarbons and lead that were detected in soil samples during previous subsurface investigations at the Site, especially those in the vicinity of the hazardous materials storage area.

In summary, TPH was not detected at concentrations above the action levels. With the exception of arsenic, and lead, concentrations of metals detected in soil samples were below US EPA industrial and residential screening levels. Concentrations of arsenic detected in soil samples are within background values for Southern California soils. Concentrations of lead were further delineated vertically by use of WET analysis. Concentration of lead in shallow samples collected at 1 and 3 ft bgs at locations near the hazardous materials storage area exceeded the STLC level for lead. The locations of the soil samples with notable lead concentrations are consistent with a previous subsurface ESA [Kleinfelder, 2003] and the location of a hazardous materials storage container at the Site. According to the LACDPW personnel, Mr. John Bodenchak, the stored material is primarily paint. The lead concentrations remained below the STLC level at 7 ft bgs.

A number of VOCs and fixed gases were detected in soil vapor samples. The VOC detections are below actionable thresholds given the current use of the Site and future use as recreational open space. If surface uses change, additional sampling may be warranted, to confirm these values are below regulatory thresholds for the intended use. The absence of detectable levels of methane at the two soil vapor sampling locations provides additional evidence that the closed landfill and nearby oil wells do not appear to be of significant environmental concern to the Site.

LIMITATIONS AND CLOSURE

Geosyntec services were performed and this report has been prepared in accordance with generally accepted professional standards of care applicable to the scope of services authorized by the client, and no other warranty is provided in connection therewith.

Consistent with applicable professional standards of care, our opinions and recommendations were based in part on data furnished by others. Although we were not able to independently verify such data, we did evaluate these data to determine whether it was consistent with other information that we developed in the course of our performance of the scope of services.

Geosyntec appreciates the opportunity to provide these environmental services to BonTerra Psomas in support of this important LACDPW project. Please contact the individuals below if you have questions regarding the content of this Report.

Sincerely,

Zahra A. Amini, Ph.D.
Engineer

Eric Smalstig, P.E.
Principal

All units in mg/kg - Milligrams per kilogram
ND - Not Detected. Parameter not detected above laboratory reporting limit
*The Regional Screening Levels (RSLs) [U.S. EPA, June 2015] are for high aliphatic (i.e., linear chain) total petroleum hydrocarbons, carbon chain length of 19 to 32 carbon atoms, due to the presence of the two classes of hydrocarbons detected (i.e., motor oil and diesel range) by the laboratory. Laboratory results did not indicate the presence of aromatic (ring compound) petroleum hydrocarbons (e.g., gasoline range hydrocarbons)

TABLE 4

Soil Vapor Data Summary

Limited Phase II Site Assessment

Pacoima Spreading Grounds Headworks

Location	SV-1	SV-7	RSL (R)	RSL (I)
Depth (ft)	**10**	**10**		
VOCs				
Acetone	22	14	3.2E+07	2.8E+08
Benzene	36	ND	3.6E+02	3.2E+03
2-Butanone	8.5	7.7	NL	NL
1,4-Dichlorobenzene	5.0	7.1	2.6E+02	2.2E+03
Dichlorodifluoromethane	2.7	ND	1.0E+05	8.8E+05
Ethylbenzene	15	ND	1.1E+03	9.8E+03
4-Ethyltoluene	8.7	ND	NL	NL
Tetrachloroethene	47	21	1.1E+04	9.4E+04
Toluene	200	ND	5.2E+06	4.4E+07
1,2,4-Trimethylbenzene	23	ND	7.3E+03	6.2E+04
1,3,5-Trimethylbenzene	7.9	ND	NL	NL
o-Xylene	26	ND	1.0E+05	8.8E+05
p/m-Xylene	100	ND	1.0E+05	8.8E+05
Fixed Gases				
Carbon Dioxide	1.95	2.48	NA	NA
Oxygen (+Argon)	21.2	20.6	NA	NA
Nitrogen	76.9	76.9	NA	NA

Notes:

Samples Collected on 08/26/2015

Analyzed using EPA method TO-15 and ASTM method D-1946

All units in ug/m^3- Micrograms per cubic meter

ND - Not Detected. Parameter not detected above laboratory reporting limit

NL-Not Listed

NA-Not Applicable

RSL - Regional Screening Level. (I) = Industrial Soil; (R) = Residential Soil. Values from “Regional Screening Level Table” by U.S. EPA, June 2015 and “Attenuation Factors for Preliminary Screening Evaluations” by DTSC-Cal/EPA, October 2011

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Work Order Narrative

Work Order: 15-08-1559 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 08/21/15. They were assigned to Work Order 15-08-1559.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Glossary of Terms and Qualifiers

Work Order: 15-08-1559 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Work Order Narrative

Work Order: 15-08-1559 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 08/21/15. They were assigned to Work Order 15-08-1559.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Glossary of Terms and Qualifiers

Work Order: 15-08-1559 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

Subject: RE: PSG / HR1507-02 / ECI 15-08-1559

Hi Steve,

Based on these results and notable concentrations of lead in the following samples we would like to request WET analysis to be done on these samples:

- SV-1-1
- S-2-1
- S-3-1.5
- S-6-1

Thanks,

Zahra Amini

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Work Order Narrative

Work Order: 15-08-1559 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 08/21/15. They were assigned to Work Order 15-08-1559.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Glossary of Terms and Qualifiers

Work Order: 15-08-1559 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

SAMPLE ANOMALY REPORT

DATE: 08 / 21 / 2015

SAMPLES, CONTAINERS, AND LABELS:

Comments

- ☐ Sample(s) NOT RECEIVED but listed on COC
- ☐ Sample(s) received but NOT LISTED on COC
- ☐ Holding time expired (list client or ECI sample ID and analysis)
- ☐ Insufficient sample amount for requested analysis (list analysis)
- ☐ Improper container(s) used (list analysis)
- ☐ Improper preservative used (list analysis)
- ☐ No preservative noted on COC or label (list analysis and notify lab)
- ☐ Sample container(s) not labeled
- ☐ Client sample label(s) illegible (list container type and analysis)
- ☑ Client sample label(s) do not match COC (comment)
  - ☐ Project information
  - ☐ Client sample ID
  - ☑ Sampling date and/or time
  - ☐ Number of container(s)
  - ☐ Requested analysis
- ☐ Sample container(s) compromised (comment)
  - ☐ Broken
  - ☐ Water present in sample container
- ☐ Air sample container(s) compromised (comment)
  - ☐ Flat
  - ☐ Very low in volume
  - ☐ Leaking (not transferred; duplicate bag submitted)
  - ☐ Leaking (transferred into ECI Tedlar™ bags*)
  - ☐ Leaking (transferred into client's Tedlar™ bags*)

(-9) Collection time per label is 12:43

* Transferred at client's request.

Subject: RE: PSG / HR1507-02 / ECI 15-08-1559

Hi Steve,

Based on these results and notable concentrations of lead in the following samples we would like to request WET analysis to be done on these samples:

- SV-1-1
- S-2-1
- S-3-1.5
- S-6-1

Thanks,

Zahra Amini

Subject: RE: PSG Total and STLC Pb

Hi Steve,

We would like to request additional testing for lead only with standard turnaround time.

Could you please perform testing for total lead and soluble lead (WET) on only the 'HOLD' soil samples from the following:

S-2-3;
S-2-7;
S-3-3; and
S-3-7.

Thank you,

Zahra Amini

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Work Order Narrative

Work Order: 15-08-1921 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 08/27/15. They were assigned to Work Order 15-08-1921.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Glossary of Terms and Qualifiers

Work Order: 15-08-1921 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Work Order Narrative

Work Order: 15-08-1921 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 08/27/15. They were assigned to Work Order 15-08-1921.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Glossary of Terms and Qualifiers

Work Order: 15-08-1921 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

Table 2
Analytical Test Parameters and Constituents with MDLs/PQLs
Pacoima Spreading Grounds Enhancement Project

Volatile Organic Compounds/BTEX	MDL (µg/kg)	PQL (µg/kg)
Benzene	1.0	10.0
Carbon tetrachloride	5.0	10.0
Chlorobenzene	5.0	10.0
1,2-Dibromo-3-chloropropane (DBCP)	5.0	10.0
1,2-Dibromoethane (EDB)	5.0	10.0
1,2-Dichlorobenzene	5.0	10.0
1,4-Dichlorobenzene	5.0	10.0
1,1-Dichloroethane	5.0	10.0
1,2-Dichloroethane (EDC)	5.0	10.0
1,1-Dichloroethene	5.0	10.0
cis-1,2-Dichloroethene	5.0	10.0
trans-1,2-Dichloroethene	5.0	10.0
1,2-Dichloropropane	5.0	10.0
cis-1,3-Dichloropropene	5.0	10.0
trans-1,3-Dichloropropene	5.0	10.0
Ethylbenzene	1.0	10.0
Methylene chloride (DCM)	25.0	50.0
Styrene	5.0	10.0
1,1,2,2-Tetrachloroethane	5.0	10.0
Tetrachloroethene	2.0	10.0
Toluene (Methyl benzene)	1.0	10.0
1,2,4-Trichlorobenzene	5.0	10.0
1,1,1-Trichloroethane	5.0	10.0
1,1,2-Trichloroethane	5.0	10.0
Trichloroethene	1.5	10.0
Trichlorofluoromethane	5.0	10.0
Trichlorotrifluoroethane (Freon-113)	5.0	10.0
Vinyl chloride (Chloroethene)	5.0	10.0
o-Xylene	1.0	10.0
m,p-Xylenes	1.0	20.0

Organochlorine Pesticides	MDL (µg/kg)	PQL (µg/kg)
Chlordane (alpha)	1.0	2.0
Chlordane (gamma)	1.0	2.0
Chlordane (Total)	1.0	2.0
Endrin	1.0	2.0
Heptachlor	1.0	2.0
Heptachlor epoxide	1.0	2.0
gamma-Hexachlorocyclohexane (Gamma-BHC, Lindane)	1.0	2.0
Methoxychlor	5.0	10.0
Toxaphene	85.0	170.0

Polychlorinated Biphenyls	MDL (µg/kg)	PQL (µg/kg)
Aroclor-1016 (PCB-1016)	25.0	50.0
Aroclor-1221 (PCB-1221)	25.0	50.0
Aroclor-1232 (PCB-1232)	25.0	50.0
Aroclor-1242 (PCB-1242)	25.0	50.0
Aroclor-1248 (PCB-1248)	25.0	50.0
Aroclor-1254 (PCB-1254)	25.0	50.0
Aroclor-1260 (PCB-1260)	25.0	50.0
Aroclor-1262 (PCB-1262)	25.0	50.0

Title 22 Metals	MDL (mg/kg)	PQL (mg/kg)
Antimony	1.0	5.0
Arsenic	1.0	5.0
Barium	2.5	5.0
Beryllium	1.0	2.5
Cadmium	1.3	2.5
Chromium	2.5	5.0
Cobalt	2.5	5.0
Copper	2.5	5.0
Lead	2.5	5.0
Mercury (By EPA 7471)	0.1	0.2
Molybdenum	2.5	5.0
Nickel	2.5	5.0
Selenium	1.0	5.0
Silver	2.5	5.0
Thallium	1.0	5.0
Vanadium	2.5	5.0
Zinc	2.5	5.0

Chlorinated Herbicides	MDL (µg/kg)	PQL (µg/kg)
2,4-D	10	10
Dalapon	20	20
Dinoseb (DNBP, 2-sec-Butyl-4, 6-dinitrophenol)	20	20
Pentachlorophenol (PCP)	10	10
Picloram	10	10
2,4,5-TP	10	10

Carbamates	MDL (µg/kg)	PQL (µg/kg)
Carbofuran (Furadan)	5.4	25.0
Oxamyl	16	50

Polynuclear Aromatic Hydrocarbons	MDL (mg/kg)	PQL (mg/kg)
Benzo(a)anthracene	0.010	0.020
Benzo(a)pyrene	0.010	0.020
Benzo(b)fluoranthene	0.010	0.020
Benzo(k)fluoranthene	0.010	0.020
Chrysene	0.010	0.020
Dibenzo(a,h)anthracene	0.010	0.020
Indeno(1,2,3-cd)pyrene	0.010	0.020
Acenaphthene	0.010	0.020
Anthracene	0.010	0.020
Fluoranthene	0.010	0.020
Fluorene	0.010	0.020
Naphthalene	0.010	0.020
Pyrene	0.010	0.020

Semi-Volatile Organic Compounds	MDL (mg/kg)	PQL (mg/kg)
Bis(2-ethylhexyl) phthalate	0.25	0.50
Hexachlorobenzene	0.25	0.50
Hexachlorocyclopentadiene	0.25	0.50

Dioxin	MDL (ηg/kg)	PQL (ηg/kg)
2,3,7,8-TCDD	0.077-0.15	2.000

Notes:

Millgrams per kilogram (mg/kg), parts per million.
Micrograms per kilogram (µg/kg), parts per billion.
Nanograms per kilogram (ηg/kg), parts per trillion.
Method Detection Limit (MDL) and Practical Quantitation Limit (PQL).
Parameters tested in accordance with Table 1. Soil Sampling Parameters, Vulcan Developed Soil Concentration Levels. Some parameters omitted (approved in advance by Vulcan).

DRAFT

Notes:

Not detected (ND) above the indicated laboratory method detection limit (MDL).

'J' indicates detected above the laboratory MDL and below the laboratory practical quantitation limit (PQL).

Milligrams per kilogram (mg/kg), micrograms per kilogram (µg/kg), nanograms per kilogram (ŋg/kg).

Unless identified, all other constituents were not detected above the MDL.

1.0 INTRODUCTION

1.1 Purpose of Analysis and Study Objectives

This Noise Impact Analysis has been prepared to determine the noise impacts associated with the proposed Pacoima Spreading Grounds Improvement Project (proposed project). The following is provided in this report:

- A description of the study area and the proposed project;
- Information regarding the fundamentals of noise;
- Information regarding the fundamentals of vibration;
- A description of the local noise guidelines and standards;
- An evaluation of the current noise environment;
- An analysis of the potential short-term construction-related noise impacts from the proposed project; and,
- An analysis of long-term operations-related noise impacts from the proposed project.

1.2 Site Location and Study Area

The project site is on County of Los Angeles (County) owned property that is located within the northern portion of the City of Los Angeles (City) and is located on the west side of the Pacoima Diversion Channel. The project site is approximately 169 acre in area, bisected by Arleta Avenue and Devonshire Street and is hydraulically connected by pipes underneath these roads. The project site is bordered by Filmore Street to the southeast, Woodman Avenue to the west, San Jose Street to the north, and Arleta Avenue to the northeast and is bisected by Devonshire Street. The Project Location Map is shown in Figure 1 on page 11.

1.3 Proposed Project Description

The principle objective of the proposed project is to increase groundwater recharge of the San Fernando Groundwater Basin by increasing the facility's storage capacity and restoring its percolation rate through excavation and reconfiguration of the spreading basins. The proposed project would include improvements to the intake structure as well as sediment removal and reconfiguration of the spreading basins. The proposed site plan is shown in Figure 2 on page 12.

Intake Structure Improvements

The existing intake structure will be improved by replacing the current intake canal with four 54-inch diameter Reinforced concrete pipes (RCPs). The pipes will extend from the headworks to the culverts that convey water to the spreading basins. After the pipes are installed, the intake channel will be backfilled with approximately 27,850 cubic yards of sediment removed from the spreading basins. Due to the variability of uncontrolled flows in Pacoima Diversion Channel, careful operation of the radial gate is currently required to regulate flows into the intake canal. When flows in excess of 600 cubic feet per second (cfs) enter the intake canal, water can potentially overtop the intake canal, resulting in localized flooding. Replacing the intake canal with pipes will restrict the intake to the design flow rate of 600 cfs and eliminate the potential for overtopping the intake canal.

Recharge Basin Reconfiguration and Sediment Removal

The recharge basins will be reconfigured and deepened to allow for greater percolation and capacity. Approximately 1.6 million cubic yards of sediment will be excavated in order to completely remove the underlying clay layers; however, only 1.37 million cubic yards of sediment will be exported from the site. The remainder of the sediment will be used to backfill the existing intake channel or be returned to the spreading basins to bring the basin inverts up to their finished elevation.

The proposed project includes transportation and placement of excavated material at facilities prepared and designated to accept such material. A total of up to 2,800 tons per day will be exported to three sediment disposal sites have been identified for consideration, either individually or in combination: Boulevard Pit, Sheldon Pit, and the Cal-Mat Pit. All three of these sites are located in the Sun Valley area of Los Angeles. In addition up to 2,200 tons per day, consisting of all organic material, concrete demolition, and some sediment will be transported Sunshine Canyon Landfill that is located northwest of the Pacoima Spreading Grounds.

The haul routes from the Pacoima Spreading Grounds site to the sediment disposal sites and to Sunshine Canyon Landfill have been identified and are detailed below:

- **Modified Haul Route A to Boulevard Pit.** Loaded trucks would travel northeast on Paxton Street to access the I-5 Southbound Freeway, taking the Sheldon Street exit and turning (right) onto Laurel Canyon Boulevard and then turn east (right) on Branford Street to access the Boulevard Pit (5.4 miles). The trucks would return from Boulevard Pit by traveling east on Branford Street and turning (left) on to Glen Oaks Boulevard to north on Osborne Street, to east on Foothill Boulevard, to I-210 westbound, to SR-118 westbound, and finally exiting at San Fernando Boulevard to return to the Pacoima Spreading Grounds on Paxton Avenue (8.4 miles). The round trip would be 13.8 miles.

- **Modified Haul Route A to Sheldon and Cal-Mat Pits**. Loaded trucks would travel northeast on Paxton Street to access the I-5 Southbound Freeway, taking the Penrose Street exit and turning (right) onto San Fernando Road and then turn east (right) on Tuxford Street and then turn west (left) onto Glenoaks Boulevard to access both the Sheldon Pit and Cal-Mat Pit (average of 7.5 miles). The trucks would return by traveling west on Glen Oaks Boulevard to north on Osborne Street, to east on Foothill Boulevard, to I-210 westbound, to SR-118 westbound, and finally exiting at San Fernando Boulevard to return to the Pacoima Spreading Grounds on Paxton Avenue (average of 8.4 miles). The average round trip would be 15.9 miles.

- **Haul Route B to Boulevard, Sheldon and Cal-Mat Pits**. Loaded trucks would travel northeast on Paxton Street to access San Fernando Road. Heading south on San Fernando Road, the trucks either turn northeast (left) on Branford Street and then turn right on Glenoaks Boulevard to access the Sheldon Pit or Cal-Mat Pit (5.3 miles), or turn southwest (right) on Branford Street to access the Boulevard Pit (3.8 miles). The trucks would return be retracing the same route. The average round trip would be 9.6 miles if all three Pits are used or 10.6 miles if only Sheldon and Cal-mat pits are used.

- **Haul Route C to Sunshine Canyon Landfill.** Loaded trucks would travel west on Devnoshire Street to access the I-405 Northbound Freeway and I-5 Northbound Freeway, exiting the I-5 Freeway at Roxford Street, then head southwest on Roxford Street, northwest on Sepulveda Boulevard, northwest on San Fernando Road, and then turn left onto Sunshine Canyon Road to access the Sunshine Canyon Landfill (6.9 miles). The trucks would return retracing the same route. The average round trip would be 13.8 miles.

As detailed in Table 10-1 of the *Revised Traffic Impact Study Pacoima Spreading Grounds Improvement Project* (Traffic Study), prepared by Linscott Law & Greenspan, July 13, 2017, 35 percent of the haul trucks would use Route A, 26 percent of the haul trucks would use Route B and 39 percent of the haul trucks would use Route C.

Project Schedule

The proposed project is expected to occur over an approximately 20-month period, starting in 2018 and would be completed in 2020. Excavation activities will take place year-round, and the spreading grounds will not be operated for the duration of the proposed project's construction. Activities will take place five days a week between the hours of 9:00 a.m. and 5:30 p.m. on Monday through Friday, with a 30 minute lunch break, for a total workday of 8 hours.

1.4 Sensitive Receptors in Project Vicinity

The project site is located in a residential community and is surrounded on all sides by residential and park uses. As detailed in the site plan shown in Figure 2 on page 12, the proposed improvements would disturb most but not all of the spreading basin property as there are areas around the perimeter of project site that would not be disturbed. The nearby off-site sensitive receptors to each portion of the proposed project are detailed below and the distances are based on the distance from the proposed disturbed areas on the project site to the nearest structure for homes and the church or use area for parks.

West Settling Basin

The proposed West Settling Basin is located on the northern side of the project site and is bounded by Arleta Avenue to the northeast. The nearby sensitive receptors consist of: single-family homes located on the south side of San Jose Street and as near as 40 feet north of the proposed improvements; and single-family homes located on the northeast side of Arleta Avenue and as near as 130 feet northeast of the proposed improvements to the West Settling Basin.

East Settling Basin

The proposed East Settling Basin is located on the eastern side of the project site and is bounded by Arleta Avenue to the northeast and Devonshire Street to the south. The nearby sensitive receptors consist of: Devonshire Arleta Park that is located as near as 220 feet east of the proposed improvements; and single-family homes located on the east side of Pacoima Diversion Channel and as near as 280 feet east of the proposed improvements to the East Settling Basin.

Basin 1

The proposed Basin 1 is located on the eastern corner of the project site and is bounded by Devonshire Street to the north, Pacoima Diversion Channel to the east and Filmore Street to the southeast. The nearby sensitive receptors consist of: Devonshire Arleta Park that is located as near as 220 feet northeast of the proposed improvements; single-family homes located on the east side of Pacoima Diversion Channel and as near as 170 feet east of the proposed improvements; and single- and multi-family homes located on the southeast side of Filmore Street and as near as 125 feet southeast of the proposed improvements to Basin 1.

Basin 2

The proposed Basin 2 is located on the southeastern side of the project site and is bounded by Devonshire Street to the north and Filmore Street to the southeast. The nearby sensitive receptors consist of single-family homes located on the southeast side of Filmore Street and as near as 120 feet southeast of the proposed improvements to Basin 2.

Basin 3

The proposed Basin 3 is located on the northern side of the project site and is bounded by West Settling Basin to the east and the SCE Easement to the west. The nearby sensitive receptors consist of: single-family homes located on the south side of San Jose Street and as near as 70 feet north of the proposed improvements; and single-family homes on the east side of Hiawatha Street and as near as 70 feet west of the proposed improvements to Basin 3.

Basin 4

The proposed Basin 4 is located on the northwestern corner of the project site and is bounded by the SCE Easement to the east and Devonshire Street to the south. The nearby sensitive receptors consist of: single-family homes located on the south side of Hiawatha Street and as near as 50 feet north of the proposed improvements; and single-family homes on the east side of Blackhawk Street and as near as 60 feet west of the proposed improvements to Basin 4.

Basin 5

The proposed Basin 5 is located on the western side of the project site and is bounded by Devonshire Street to the north and Devonwood Park to the west. The nearby sensitive receptors consist of: Devonwood Park located as near as 30 feet west of the proposed improvements; and single-family homes located on the north side of Devonshire Street and as near as 135 feet north of the proposed improvements to Basin 5.

Basin 6

The proposed Basin 6 is located on the southwest corner of the project site and is bounded by and Devonwood Park to the north, Woodman Avenue to the southwest and Filmore Street to the southeast. The nearby sensitive receptors consist of: Devonwood Park located as near as 40 feet north of the proposed improvements; the New Apostolic Church located on the east side of Woodman Avenue and as near as 30 feet west of the proposed improvements; and single-family homes located on the east side of Woodman Avenue and as near as 30 feet west of the proposed improvements to Basin 6.

Diversion Channel Intake

The proposed diversion channel intake improvements is located in the northeast corner of the project site and is bounded by the Pacoima Diversion Channel to the east and Arleta Avenue to the southwest. The nearby sensitive receptors consist of single-family homes located on the east side of Minnehaha Street and as near as 40 feet west of the proposed improvements to the diversion channel intake.

Haul Routes

The roadways with nearby sensitive receptors to each of the four proposed Haul Routes described above are detailed below.

- **Modified Haul Route A to Boulevard Pit.** There are sensitive receptors located on the roadways of Arleta Avenue, Paxton Street, Laurel Canyon Road, Branford Street, Glenoaks Boulevard, Osborne Street, and Foothill Boulevard. Modified Haul Route A to Boulevard Pit would also travel on Devonshire Street, San Fernando Road, however there are no sensitive receptors located along the affected road segments.

- **Modified Haul Route A to Sheldon Pit and Cal-Mat Pit.** There are sensitive receptors located on the roadways of Arleta Avenue, Paxton Street, Glenoaks Boulevard, Osborne Street, and Foothill Boulevard. Modified Haul Route A to Sheldon and Cal-Mat Pits would also travel on

Devonshire Street, Penrose Street, Tuxford Street, Wentworth Street, and San Fernando Road, however there are no sensitive receptors located along the affected road segments.

- **Haul Route B.** There are sensitive receptors located on the roadways of Arleta Avenue, Paxton Street and San Fernando Road. Haul Route B would also travel on Devonshire Street, Branford Street, Wentworth Street, and San Fernando Road, however there are no sensitive receptors located along the affected road segments.

- **Haul Route C.** There are sensitive receptors located on the roadways of Devonshire Street, Roxford Street, and San Fernando Road. Haul Route C would also travel on Sepulveda Boulevard, however there are no sensitive receptors located along the affected road segments.

The nearby sensitive receptors on Paxton Street consist of: single- and multi-family homes that are located as near as 20 feet from the travel lanes; Ritchie Valens Park that is located as near as 15 feet from the travel lanes; and Telfair Elementary School that is located as near as 25 feet from the travel lanes of Paxton Street.

The nearby sensitive receptors on Laurel Canyon Boulevard consist of: multi-family and mobile homes as near as 25 feet from the travel lanes; and Fernangeles Recreation Center located as near as 15 feet from the travel lanes of Laurel Canyon Boulevard.

The nearby sensitive receptors on Branford Street consist of single- and multi-family homes as near as 25 feet from the travel lanes of Branford Street.

The nearby sensitive receptors on Glenoaks Boulevard consist of mobile homes as near as 20 feet from the travel lanes of Glen Oaks Boulevard.

The nearby sensitive receptors to Osborne Street consist of multi-family homes as near as 15 feet from the travel lanes of Osborne Street.

The nearby sensitive receptors to Foothill Boulevard consist of multi-family homes as near as 25 feet from the travel lanes of Foothill Boulevard.

The nearby sensitive receptors on San Fernando Road consist of: single- and multi-family homes as near as 110 feet from the travel lanes; and Pacifica Hospital of the Valley that is located as near as 180 feet from the travel lanes of San Fernando Road. For the portion of San Fernando Road near Sunshine Canyon Landfill the nearby sensitive receptors consist of single-family homes as near as 90 feet from the travel lanes.

1.5 Standard Noise Regulatory Conditions

The proposed project will be required to comply with the following regulatory conditions from the City of Los Angeles and State of California.

City of Los Angeles Municipal Code

The following lists the City of Los Angeles Municipal Code regulations that are applicable to all development projects in the City.

Section 41.40(a) Construction Noise

Section 41.40(a) of the City's Municipal Code limits construction activities, including excavation works to between the hours of 9:00 p.m. and 7:00 a.m., any day of the week.

State of California Rules

The following lists the State of California rules that are applicable to the project.

California Vehicle Code Section 27200-27207 – On-Road Vehicle Noise

California Vehicle Code Section 27200-27207 provides noise limits for vehicles operated in California. For vehicles over 10,000 pounds noise is limited to 88 dB for vehicles manufactured before 1973, 86 dB for vehicles manufactured before 1975, 83 dB for vehicles manufactured before 1988, and 80 dB for vehicles manufactured after 1987. All measurements are based at 50 feet from the vehicle. For the project, "on-road" vehicles over 10,000 pounds would include haul trucks and construction equipment delivery trucks/tractor trailers.

California Vehicle Section 38365-38380 – Off-Road Vehicle Noise

California Vehicle Code Section 38365-38380 provides noise limits for off-highway motor vehicles operated in California. 92 dBA for vehicles manufactured before 1973, 88 dBA for vehicles manufactured before 1975, 86 dBA for vehicles manufactured before December 31, 1985, and 82 dBA for vehicles manufactured after December 31, 1985. All measurements are based at 50 feet from the vehicle.

1.6 Summary of Analysis Results

The following is a summary of the proposed project's impacts with regard to the State CEQA Guidelines noise checklist questions.

Expose persons to noise levels in excess of standards?

Less than significant impact.

Expose persons to excessive groundborne vibration?

Less than significant impact.

Result in a substantial permanent increase in ambient noise levels above existing levels without the proposed project?

No impact.

Result in a substantial temporary increase in ambient noise levels above existing levels without the proposed project?

Potentially significant impact. Implementation of Mitigation Measure 1 would reduce the impact to less than significant levels.

Expose persons to excessive noise levels from aircraft?

No impact.

1.6 Mitigation Measures Required for the Proposed Project

This analysis found that adherence to the State and City noise and vibration regulations detailed in Section 1.5 above and through implementation of the following mitigation, all noise and vibration impacts would be reduced to less than significant levels.

Mitigation Measure 1:

The County of Los Angeles Department of Public Works shall construct a 8-foot high temporary sound wall along the shared property line with the nearby homes located northwest of the Diversion Channel Improvements. The temporary sound wall shall extend a minimum of 100 feet past the extent of the Diversion Channel demolition activities and shall be constructed of minimum ½-inch plywood or Oriented Strand Board (OSB). The temporary sound wall shall be installed prior to the start of demolition activities and shall remain until the completion of the Diversion Channel improvements.

2.0 NOISE FUNDAMENTALS

Noise is defined as unwanted sound. Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm, or when it has adverse effects on health. Sound is produced by the vibration of sound pressure waves in the air. Sound pressure levels are used to measure the intensity of sound and are described in terms of decibels. The decibel (dB) is a logarithmic unit which expresses the ratio of the sound pressure level being measured to a standard reference level. A-weighted decibels (dBA) approximate the subjective response of the human ear to a broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear.

2.1 Noise Descriptors

Noise Equivalent sound levels are not measured directly, but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (Leq) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. The peak traffic hour Leq is the noise metric used by California Department of Transportation (Caltrans) for all traffic noise impact analyses.

The Day-Night Average Level (Ldn) is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time of day corrections require the addition of ten decibels to sound levels at night between 10 p.m. and 7 a.m. While the Community Noise Equivalent Level (CNEL) is similar to the Ldn, except that it has another addition of 4.77 decibels to sound levels during the evening hours between 7 p.m. and 10 p.m. These additions are made to the sound levels at these time periods because during the evening and nighttime hours, when compared to daytime hours, there is a decrease in the ambient noise levels, which creates an increased sensitivity to sounds. For this reason the sound appears louder in the evening and nighttime hours and is weighted accordingly. The County of Los Angeles relies on the CNEL noise standard to assess transportation-related impacts on noise sensitive land uses.

2.2 Tone Noise

A pure tone noise is a noise produced at a single frequency and laboratory tests have shown that humans are more perceptible to changes in noise levels of a pure tone. For a noise source to contain a "pure tone," there must be a significantly higher A-weighted sound energy in a given frequency band than in the neighboring bands, thereby causing the noise source to "stand out" against other noise sources. A pure tone occurs if the sound pressure level in the one-third octave band with the tone exceeds the average of the sound pressure levels of the two contiguous one-third octave bands by:

- 5 dB for center frequencies of 500 hertz (Hz) and above
- 8 dB for center frequencies between 160 and 400 Hz
- 15 dB for center frequencies of 125 Hz or less

2.3 Noise Propagation

From the noise source to the receiver, noise changes both in level and frequency spectrum. The most obvious is the decrease in noise as the distance from the source increases. The manner in which noise reduces with distance depends on whether the source is a point or line source as well as ground absorption, atmospheric effects and refraction, and shielding by natural and manmade features. Sound from point sources, such as air conditioning condensers, radiate uniformly outward as it travels away

from the source in a spherical pattern. The noise drop-off rate associated with this geometric spreading is 6 dBA per each doubling of the distance (dBA/DD). Transportation noise sources such as roadways are typically analyzed as line sources, since at any given moment the receiver may be impacted by noise from multiple vehicles at various locations along the roadway. Because of the geometry of a line source, the noise drop-off rate associated with the geometric spreading of a line source is 3 dBA/DD.

2.4 Ground Absorption

The sound drop-off rate is highly dependent on the conditions of the land between the noise source and receiver. To account for this ground-effect attenuation (absorption), two types of site conditions are commonly used in traffic noise models, soft-site and hard-site conditions. Soft-site conditions account for the sound propagation loss over natural surfaces such as normal earth and ground vegetation. For point sources, a drop-off rate of 7.5 dBA/DD is typically observed over soft ground with landscaping, as compared with a 6.0 dBA/DD drop-off rate over hard ground such as asphalt, concrete, stone and very hard packed earth. For line sources a 4.5 dBA/DD is typically observed for soft-site conditions compared to the 3.0 dBA/DD drop-off rate for hard-site conditions. Caltrans research has shown that the use of soft-site conditions is more appropriate for the application of the Federal Highway Administration (FHWA) traffic noise prediction model used in this analysis.

3.0 GROUND-BORNE VIBRATION FUNDAMENTALS

Ground-borne vibrations consist of rapidly fluctuating motions within the ground that have an average motion of zero. The effects of ground-borne vibrations typically only cause a nuisance to people, but at extreme vibration levels damage to buildings may occur. Although ground-borne vibration can be felt outdoors, it is typically only an annoyance to people indoors where the associated effects of the shaking of a building can be notable. Ground-borne noise is an effect of ground-borne vibration and only exists indoors, since it is produced from noise radiated from the motion of the walls and floors of a room and may also consist of the rattling of windows or dishes on shelves.

3.1 Vibration Descriptors

There are several different methods that are used to quantify vibration amplitude such as the maximum instantaneous peak in the vibrations velocity, which is known as the peak particle velocity (PPV) or the root mean square (rms) amplitude of the vibration velocity. Due to the typically small amplitudes of vibrations, vibration velocity is often expressed in decibels and is denoted as (L_v) and is based on the rms velocity amplitude. A commonly used abbreviation for vibration decibels is "VdB", which in this text, is when L_v is based on the reference quantity of 1 micro inch per second.

3.2 Vibration Perception

Typically, developed areas are continuously affected by vibration velocities of 50 VdB or lower. These continuous vibrations are not noticeable to humans whose threshold of perception is around 65 VdB. Off-site sources that may produce perceptible vibrations are usually caused by construction equipment, steel-wheeled trains, and traffic on rough roads, while smooth roads rarely produce perceptible ground-borne noise or vibration.

3.3 Vibration Propagation

The propagation of ground-borne vibration is not as simple to model as airborne noise. This is due to the fact that noise in the air travels through a relatively uniform median, while ground-borne vibrations travel through the earth which may contain significant geological differences. There are three main types of vibration propagation; surface, compression, and shear waves. Surface waves, or Rayleigh waves, travel along the ground's surface. These waves carry most of their energy along an expanding circular wave front, similar to ripples produced by throwing a rock into a pool of water. P-waves, or compression waves, are body waves that carry their energy along an expanding spherical wave front. The particle motion in these waves is longitudinal (i.e., in a "push-pull" fashion). P-waves are analogous to airborne sound waves. S-waves, or shear waves, are also body waves that carry energy along an expanding spherical wave front. However, unlike P-waves, the particle motion is transverse or "side-to-side and perpendicular to the direction of propagation."

As vibration waves propagate from a source, the vibration energy decreases in a logarithmic nature and the vibration levels typically decrease by 6 VdB per doubling of the distance from the vibration source. As stated above, this drop-off rate can vary greatly depending on the soil but has been shown to be effective enough for screening purposes, in order to identify potential vibration impacts that may need to be studied through actual field tests.

4.0 REGULATORY SETTING

The project site is located in the City of Los Angeles. Noise regulations and standards are addressed by various federal, state, and local government agencies. The agencies responsible for regulating noise that are applicable to the project are discussed below.

4.1 Federal Regulations

The adverse impact of noise was officially recognized by the federal government in the Noise Control Act of 1972, which serves three purposes:

- Promulgating noise emission standards for interstate commerce
- Assisting state and local abatement efforts
- Promoting noise education and research

The Federal Office of Noise Abatement and Control (ONAC) was initially tasked with implementing the Noise Control Act. However, the ONAC has since been eliminated, leaving the development of federal noise policies and programs to other federal agencies and interagency committees. For example, the Occupational Safety and Health Administration (OSHA) agency prohibits exposure of workers to excessive sound levels. The Department of Transportation (DOT) assumed a significant role in noise control through its various operating agencies. The Federal Aviation Administration (FAA) regulates noise of aircraft and airports. Surface transportation system noise is regulated by a host of agencies, including the Federal Transit Administration (FTA). Transit noise is regulated by the federal Urban Mass Transit Administration (UMTA), while freeways that are part of the interstate highway system are regulated by the Federal Highway Administration (FHWA). Finally, the federal government actively advocates that local jurisdictions use their land use regulatory authority to arrange new development in such a way that "noise sensitive" uses are either prohibited from being sited adjacent to a highway or, alternately that the developments are planned and constructed in such a manner that potential noise impacts are minimized.

Although the proposed project is not under the jurisdiction of the FTA, the FTA is the only agency that has defined what constitutes significant construction and transportation source noise impacts from implementing a project. The FTA standards are based on extensive studies by the FTA and other governmental agencies on the human effects and reaction to noise from construction and transportation sources. The FTA recommends developing construction noise criteria on a project-specific basis that utilizes local noise ordinances if possible. However, local noise ordinances usually relates to nuisance and hours of allowed activity and sometimes specify limits in terms of maximum levels, but are generally not practical for assessing the noise impacts of a construction project. Project construction noise criteria should take into account the existing noise environment, the absolute noise levels during construction activities, the duration of the construction, and the adjacent land uses. A summary of the FTA findings for a detailed construction noise assessment are provided below in Table A.

Table A – FTA Construction Noise Criteria

	Day (dBA Leq)		Night (dBA Leq)	
Land Use	**1-Hour**	**8-Hour**	**1-Hour**	**8-Hour**
Residential	90	80	80	70
Commercial	100	85	100	85
Industrial	100	90	100	90

Source: Federal Transit Administration, 2006.

Since the federal government has preempted the setting of standards for noise levels that can be emitted by the transportation sources, the local jurisdictions are restricted to regulating the noise generated by transportation systems (public roads) through nuisance abatement ordinances and land use planning. A summary of the FTA findings for transportation noise sources are provided below in Table B.

Table B – FTA Transportation Noise Sources Effects on Cumulative Noise Exposure

Existing Noise Exposure (dBA Leq or Ldn)	Allowable Noise Impact Exposure dBA Leq or Ldn		
	Project Only	Combined	Noise Exposure Increase
45	51	52	+7
50	53	55	+5
55	55	58	+3
60	57	62	+2
65	60	66	+1
70	64	71	+1
75	65	75	0

Source: Federal Transit Administration, 2006.

4.2 State Regulations

Noise Standards

California Department of Health Services Office of Noise Control

Established in 1973, the California Department of Health Services Office of Noise Control (ONC) was instrumental in developing regulatory tools to control and abate noise for use by local agencies. One significant model is the "Land Use Compatibility for Community Noise Environments Matrix," which allows the local jurisdiction to clearly delineate compatibility of sensitive uses with various incremental levels of noise and which is shown in Figure 3 on page.

California Vehicle Code Section 27200-27207 – On-Road Vehicle Noise

California Vehicle Code Section 27200-27207 provides noise limits for vehicles operated in California. For vehicles over 10,000 pounds noise is limited to 88 dB for vehicles manufactured before 1973, 86 dB for vehicles manufactured before 1975, 83 dB for vehicles manufactured before 1988, and 80 dB for vehicles manufactured after 1987. All measurements are based at 50 feet from the vehicle. For the project, "on-road" vehicles over 10,000 pounds would include haul trucks and construction equipment delivery trucks/tractor trailers.

California Vehicle Section 38365-38380 – Off-Road Vehicle Noise

California Vehicle Code Section 38365-38380 provides noise limits for off-highway motor vehicles operated in California. 92 dBA for vehicles manufactured before 1973, 88 dBA for vehicles manufactured before 1975, 86 dBA for vehicles manufactured before 1986, and 82 dBA for vehicles manufactured after December 31, 1985. All measurements are based at 50 feet from the vehicle.

Vibration Standards

Title 14 of the California Administrative Code Section 15000 requires that all state and local agencies implement the California Environmental Quality Act (CEQA) Guidelines, which requires the analysis of

exposure of persons to excessive groundborne vibration. However, no statute has been adopted by the state that quantifies the level at which excessive groundborne vibration occurs.

Caltrans issued the *Transportation- and Construction-Induced Vibration Guidance Manual* in 2004. The manual provides practical guidance to Caltrans engineers, planners, and consultants who must address vibration issues associated with the construction, operation, and maintenance of Caltrans projects. However, this manual is also used as a reference point by many lead agencies and CEQA practitioners throughout California, as it provides numeric thresholds for vibration impacts. Thresholds are established for continuous and transient sources of vibration, which found that the human response becomes distinctly perceptible at 0.25 inch per second PPV for transient sources and 0.04 inch per second PPV for continuous sources.

Exhibit I: Guidelines for Noise Compatible Land Use

(Based on the Governor's Office of Planning and Research, "General Plan Guidelines", 1990. To help guide determination of appropriate land use and mitigation measures vis-a-vis existing or anticipated ambient noise levels)

Land Use Category	Day-Night Average Exterior Sound Level (CNEL dB)						
	50	55	60	65	70	75	80
Residential Single Family, Duplex, Mobile Home	A	C	C	C	N	U	U
Residential Multi-Family	A	A	C	C	N	U	U
Transient Lodging, Motel, Hotel	A	A	C	C	N	U	U
School, Library, Church, Hospital, Nursing Home	A	A	C	C	N	N	U
Auditorium, Concert Hall, Ampitheater	C	C	C	C/N	U	U	U
Sports Arena, Outdoor Spectator Sports	C	C	C	C	C/U	U	U
Playground, Neighborhood Park	A	A	A	A/N	N	N/U	U
Golf Course, Riding Stable, Water Recreation, Cemetery	A	A	A	A	N	A/N	U
Office Building, Business, Commercial, Professional	A	A	A	A/C	C	C/N	N
Agriculture, Industrial, Manufacturing, Utilities	A	A	A	A	A/C	C/N	N

A = Normally acceptable. Specified land use is satisfactory, based upon assumption buildings involved are conventional construction, without any special noise insulation.

C = Conditionally acceptable. New construction or development only after a detailed analysis of noise mitigation is made and needed noise insulation features are included in project design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning normally will suffice.

N = Normally unacceptable. New construction or development generally should be discouraged. A detailed analysis of noise reduction requirements must be made and noise insulation features included in the design of a project.

U = Clearly unacceptable. New construction or development generally should not be undertaken.

4.3 Local Regulations

The City of Los Angeles General Plan and Municipal Code establishes the following applicable policies related to noise and vibration. Although the project is located on County of Los Angeles-owned property, the noise-sensitive receptors in proximity to the site are located in the City. Therefore, City of Los Angeles noise regulations, rather than County, have been applied to this analysis.

City of Los Angeles General Plan Noise Element

Goal A city where noise does not reduce the quality of urban life.

Objective 2 (Nonairport)
Reduce or eliminate nonairport related intrusive noise, especially relative to noise sensitive uses.

Policy 2.2 Enforce and/or implement applicable city, State and federal regulations intended to mitigate proposed noise producing activities, reduce intrusive noise and alleviate noise that is deemed a public nuisance. (The applicable Federal and State regulations have been detailed above in Sections 4.1 and 4.2)

City of Los Angeles Municipal Code

The City of Los Angeles Municipal Code establishes the following applicable standards related to construction noise.

Section 41.40 Noise Due to Construction, Excavation Work – When Prohibited

(a) No person shall, between the hours of 9:00 P.M. and 7:00 A.M. of the following day, perform any construction or repair work of any kind upon, or any excavating for, any building or structure, where any of the foregoing entails the use of any power driven drill, riveting machine excavator or any other machine, tool, device or equipment which makes loud noises to the disturbance of persons occupying sleeping quarters in any dwelling hotel or apartment or other place of residence. In addition, the operation, repair or servicing of construction equipment and the job-site delivering of construction materials in such areas shall be prohibited during the hours herein specified. Any person who knowingly and wilfully violates the foregoing provision shall be deemed guilty of a misdemeanor punishable as elsewhere provided in this Code.

(j) As determined by the Executive Director of the Board, the provisions of Subsection (c) shall not apply to major public works construction by the City of Los Angeles and its proprietary Departments, including all structures and operations necessary to regulate or direct traffic due to construction activities. The Board, through its Executive Director, pursuant to Subsection (b) will grant a variance for this work and construction activities will be subject to all conditions of the variance as granted. Concurrent with the request for a variance, the City Department that will conduct the construction work will notify each affected Council district office and established Neighborhood Council of projects where proposed Sunday and/or Holiday work will occur.

Section 112.03 Construction Noise
Noise due to construction or repair work shall be regulated as provided by Section 41.40 of this Code.

5.0 EXISTING NOISE CONDITIONS

To determine the existing noise level environment noise measurements have been taken in the vicinity of the project site. The field survey noted that noise within the proposed project area is generally characterized by vehicular traffic on Devonshire Street, Arleta Avenue and Interstate 5 as well as aircraft noise. The following describes the measurement procedures, measurement locations, noise measurement results, and the modeling of the existing noise environment.

5.1 Noise Measurement Equipment

The short-term noise measurements were taken using a Larson-Davis Model 831 Type 1 precision sound level meter programmed in "slow" mode to record noise levels in "A" weighted form as well as the frequency spectrum of the noise broken down into 1/3 octaves. The sound level meter and microphone were mounted on a tripod five feet above the ground and were equipped with a windscreen during all measurements. The sound level meter was calibrated before and after the monitoring using a Larson-Davis calibrator, Model CAL 200. The accuracy of the calibrator is maintained through a program established through the manufacturer and is traceable to the National Bureau of Standards. The unit meets the requirements of ANSI Standard S1.4-1984 and IEC Standard 942: 1988 for Class 1 equipment. All noise level measurement equipment meets American National Standards Institute (ANSI) specifications for sound level meters (S1.4-1983 identified in Chapter 19.68.020.AA).

Noise Measurement Location

The noise monitoring locations were selected in order to obtain noise measurements of the current noise levels in the project study area and to provide a baseline for any potential noise impacts that may be created by development of the proposed project. The noise measurement sites were selected to provide a representative sampling of the noise levels created by nearby noise sources. Descriptions of the noise monitoring sites are provided below in Table C and are shown in Figure 4 on page 23. Appendix A includes a photo index of the study area and noise level measurement locations.

Noise Measurement Timing and Climate

The noise measurements were recorded between 12:19 p.m. and 2:03 p.m. on Tuesday, August 19, 2014. The local schools were observed to be in session during the noise measurements, so the noise measurements represent the anticipated noise levels that would occur during a typical workday. At the start of the noise measurements the sky was partly cloudy, the temperature was 79 degrees Fahrenheit, the humidity was 47 percent, barometric pressure was 28.88 inches of mercury, and the wind was blowing around four miles per hour. At the conclusion of the noise measurements the sky was partly cloudy, the temperature was 81 degrees Fahrenheit, the humidity was 35 percent, barometric pressure was 28.90 inches of mercury, and the wind was blowing around two miles per hour.

All traffic noise measurement durations were measured according to the standards stated in Section N-3320 of Caltrans Technical Noise Supplement (TeNS), which specifies that the measurements be a duration of at least 10 minutes and shall be continued past 10 minutes until the fluctuations in the displayed L_{eq} is less than 0.5 dBA.

5.2 Noise Measurement Results

The results of the noise level measurements are presented on the following page in Table C and the noise monitoring data printouts are included in Appendix B.

Table C – Noise Level Measurement Results

Site No.	Description	Primary Noise Source	Start Time of Measurement	Noise Level (dBA L_{eq}/L_{max})
1	Located next to the southwest corner of the intake structure.	Interstate 5 and aircraft	12:19 p.m.	56.93/69.5
2	Located west of the spreading ground on the south side of Devonwood Park and approximately 150 feet east of Woodman Avenue centerline.	Woodman Avenue, children playing in park and aircraft	12:42 p.m.	54.4/69.5
3	Located east of the spreading grounds and on the southeast side of Filmore Street and approximately 125 feet southwest of the end of Filmore Street.	Devonshire Street and aircraft	1:16 p.m.	49.6/62.3
4	Located at the parking lot on the north corner of Sun Valley High School and approximately 50 feet southeast of Sheldon Street centerline and 100 feet southwest of Telfair Avenue centerline.	Sheldon Street, Telfair Avenue and children at High School	1:50 p.m.	67.3/82.0

Notes: Noise measurements taken on August 19, 2014.

Noise Monitoring Locations

6.0 MODELING PARAMETERS AND ASSUMPTIONS

6.1 On-Site Construction Noise

The noise impacts from on-site construction of the proposed project have been analyzed through use of the FHWA's Roadway Construction Noise Model (RCNM). Although the project is not comprised of roadway construction, the FHWA compiled noise measurement data regarding the noise generating characteristics of several different types of construction equipment used during the Central Artery/Tunnel project in Boston and is applicable to all construction types. Table D below provides a list of the construction equipment that was provided by the County of Los Angeles Department of Public Works that is anticipated to be used during of construction.

Table D – Construction Equipment Noise Emissions and Usage Factors

Equipment Description	Number of Equipment	Acoustical Use Factor[1] (percent)	Spec 721.560 Lmax at 50 feet[2] (dBA, slow[3])	Actual Measured Lmax at 50 feet[4] (dBA, slow[3])
Dozer	2	40	85	82
Excavator	2	40	85	81
Mounted Impact Hammer[5]	1	20	90	90
Sediment Shaker[6]	1	50	85	87
Water Truck[7]	3	40	84	74
Street Sweeper	1	10	80	82
Dump Truck	11[8]	40	84	76

Notes:
[1] Acoustical use factor is the percentage of time each piece of equipment is operational during a typical workday.
[2] Spec 721.560 is the equipment noise level utilized by the RCNM program.
[3] The "slow" response averages sound levels over 1-second increments. A "fast" response averages sound levels over 0.125-second increments.
[4] Actual Measured is the average noise level measured of each piece of equipment during the Central Artery/Tunnel project in Boston, Massachusetts primarily during the 1990s.
[5] The mounted impact hammer would be mounted on an excavator and would be utilized for demolition of the intake structure.
[6] The nearest match to a sediment shaker in the RCNM model is a vibratory hopper.
[7] The water trucks were modelled as flat bed trucks since there was no water truck available in the RCNM model.
[8] There will be 11 dump trucks operating simultaneously, however no more than 4 dump trucks are anticipated to be operating on the spreading grounds at any time.
Source: Federal Highway Administration, 2006.

Table D also shows the associated measured noise emissions for each piece of equipment from the RCNM model and measured percentage of typical equipment use per day. Construction noise impacts to the nearby sensitive receptors have been calculated according to the equipment noise levels and usage factors listed in Table D and through use of the RCNM. For each phase of construction, the nearest piece of equipment was placed at the shortest distance of the proposed activity on the site to the nearest home and each subsequent piece of equipment was placed an additional 50 feet away in order to calculate the combined noise impacts of the simultaneous operation of all listed equipment provided in Table D. It is noted the that the noise model incorporates several additional conservative assumptions, including: (1) hard terrain on the site, whereas the site is comprised of primarily soft terrain (i.e., dirt) that provides relatively lower noise levels, (2) direct line of sight between the noise source and receptor (i.e., no barriers), and (3) stationary operation of each piece of equipment for a period of one hour, with the nearest equipment being a dozer. In reality, the on-site construction activity would not be stationary for an hour, or close to an hour, and the majority of the spreading basin excavation and channel replacement would occur at a further distance than the nearest point on the site, as modeled, and would also be below the grade of the surrounding receptors (e.g., at a lower level) thereby providing noise reduction.

Regarding the channel replacement, the model incorporated noise generation from the demolition activity, the noisiest activity for this project component. Therefore, all construction activity subsequent to the demolition (e.g., pipe installation, backfilling) would result in lower noise levels than the demolition activity and so are encompassed by the noise model.

6.2 Off-Site Vehicular Noise

The proposed project would require the export of material from the project site through the use of trucks as well as generate from vehicle trips from workers at the project site. In order to quantify the potential noise impacts created and received by the proposed project and compare them to the existing noise levels, the existing roadway noise environment was modeled using the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108 (FHWA Model). The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). Adjustments are then made to the reference energy mean emission level to account for: the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT) and the percentage of ADT which flows during the day, evening and night, the travel speed, the vehicle mix on the roadway, which is a percentage of the volume of automobiles, medium trucks and heavy trucks, the roadway grade, the angle of view of the observer exposed to the roadway and site conditions ("hard" or "soft" relates to the absorption of the ground, pavement or landscaping). The following section provides a discussion of the software and modeling input parameters used in this analysis and a discussion of the resultant existing noise model.

FHWA Model Roadway Parameters

The roadway parameters used for this study are presented in Table E. Only the roadway segments that the proposed project may generate additional vehicular trips and had sensitive land uses (i.e., residential, school, parks, libraries, and hospitals) were analyzed.

The roadway classifications are based on the roadway jurisdiction's General Plan Circulation Element. The roadway speeds are based on the posted speed limits. The distance to the nearest sensitive receptor was determined by measuring the distance from the roadway centerline to the nearest residence, school, park, or hospital. Soft site conditions were used to develop noise contours and analyze noise impacts to the analyzed roadways. Soft sites have an absorptive ground surface such as soft dirt, grass, or scattered bushes and trees and are representative of the analyzed roadways where there is landscaping in front of the potentially impacted homes.

Table E – FHWA Model Roadway Parameters

Roadway	Segment	General Plan Classification	Vehicle Speed (MPH)	Distance to Nearest Receptor (feet)
Arleta Avenue	North of Devonshire Street	Secondary	40	150
Arleta Avenue	East of Devonshire Street	Secondary	40	60
Paxton Street	North of Arleta Avenue	Secondary	40	55
Paxton Street	North of I-5 Northbound Ramps	Secondary	40	50
Laurel Canyon Boulevard	West of I-5 Southbound Ramps	Major	35	55
Laurel Canyon Boulevard	West of I-5 Northbound Off-Ramp	Major	35	55
Branford Street	North of Laurel Canyon Boulevard	Secondary	35	50

FHWA Model Traffic Volumes

The average daily traffic (ADT) volumes on the study area roadways were obtained from the *Revised Traffic Impact Study Pacoima Spreading Grounds Improvement Project* (Traffic Impact Analysis), prepared by Linscott Law & Greenspan, July 13, 2017. Since the Traffic Impact Analysis only provided peak hour and mid-day volumes, the ADT was calculated by multiplying the sum of all measured hours (6 hours total) by 4, which was calculated by dividing 24 hours by 6 hours. The project-only passenger car equivalent (PCE) trips provided in the Traffic Impact Analysis were converted back to non-PCE volumes by dividing the project trips by 2.5, which is based on utilizing 14 cubic yard trucks, similar to what was utilized in the Traffic Impact Analysis. The ADT volumes have been provided for existing without project and existing with Alternatives 1 through 4 conditions. The ADT volumes used in this analysis are shown in Table F.

Table F – Average Daily Traffic Volumes

Roadway	Segment	Average Daily Traffic Volumes				
		Existing	Existing + Alt 1	Existing + Alt 2	Existing + Alt 3	Existing + Alt 4
Arleta Avenue	North of Devonshire Street	14,380	14,790	14,790	14,790	14,790

FHWA Model Vehicle Mix Assumptions

The vehicle mixes used in the FHWA-RD-77-108 Model are shown on the following page in Table G. The Arterial without project is based on typical vehicle mixes observed in Southern California. The Arterial with project vehicle mix has been calculated based on Paxton Street north of Arleta Avenue, which is the road with the highest ratio of haul trucks added to the road by the proposed project. It should also be noted that the FHWA-RD-77-108 Model only provides either medium or heavy truck classifications and both the 14 cubic yard and 18 cubic yard trucks would be categorized as heavy trucks, so the use of the 14 cubic yard trucks in this analysis provides for the worst-case conditions.

FHWA Model Source Assumptions

To assess the roadway noise generation in a uniform manner, all vehicles are analyzed at the single lane equivalent acoustic center of the roadway being analyzed. In order to determine the height above the road grade where the noise is being emitted from, each type of vehicle has been analyzed independently with autos at road grade, medium trucks at 2.3 feet above road grade, and heavy trucks at 8 feet above road grade. These elevations were determined through a noise-weighted average of the elevation of the exhaust pipe, tires and mechanical parts in the engine, which are the primary noise emitters from a vehicle.

Table G – Roadway Vehicle Mix

Vehicle Type	Traffic Flow Distributions			
	Day (7 a.m. to 7 p.m.)	Evening (7 p.m. to 10 p.m.)	Night (10 p.m. to 7 a.m.)	Overall
Arterial Without Project				
Automobiles	69.50%	12.90%	9.60%	92.00%
Medium Trucks	1.44%	0.06%	1.50%	3.00%
Heavy Trucks	2.40%	0.10%	2.50%	5.00%
Arterial With Project				
Automobiles	67.50%	12.50%	9.30%	89.28%
Medium Trucks	1.40%	0.06%	1.45%	2.91%
Heavy Trucks	5.37%	0.10%	2.42%	7.89%

6.3 Vibration

Construction activity can result in varying degrees of ground vibration, depending on the equipment used on the site. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Buildings in the vicinity of the construction site respond to these vibrations with varying results ranging from no perceptible effects at the low levels to slight damage at the highest levels. Table H gives approximate vibration levels for particular construction activities. The data in Table H provides a reasonable estimate for a wide range of soil conditions.

Table H – Vibration Source Levels for Construction Equipment

Equipment		Peak Particle Velocity (inches/second)	Approximate Vibration Level (L_v) at 25 feet
Pile driver (impact)	Upper range	1.518	112
	typical	0.644	104
Pile driver (sonic)	Upper range	0.734	105
	typical	0.170	93
Clam shovel drop (slurry wall)		0.202	94
Vibratory Roller		0.210	94
Hoe Ram		0.089	87
Large bulldozer		0.089	87
Caisson drill		0.089	87
Loaded trucks		0.076	86
Jackhammer		0.035	79
Small bulldozer		0.003	58

Source: Federal Transit Administration, May 2006.

The construction-related vibration impacts have been calculated through the vibration levels shown above in Table H and through typical vibration propagation rates. The equipment assumptions were based on the equipment lists provided on page 20 in Table D.

7.0 IMPACT ANALYSIS

7.1 CEQA Thresholds of Significance

Consistent with the California Environmental Quality Act (CEQA) and the State CEQA Guidelines, a significant impact related to noise would occur if a proposed project is determined to result in:

- Exposure of persons to or generation of noise levels in excess of standards established in the local General Plan or noise ordinance, or applicable standards of other agencies;
- Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;
- A substantial permanent increase in ambient noise levels in the project vicinity above existing levels without the proposed project;
- A substantial temporary or periodic increase in ambient noise levels in the project vicinity above noise levels existing without the proposed project; or
- Exposure of persons residing or working in the project area to excessive noise levels from aircraft.

7.2 Generation of Noise Levels in Excess of Standards

The following section compares the potential noise emissions associated with the construction and operation of the proposed project to the City and FTA standards for on-site activity and FHWA standards for off-site (i.e., transportation) activity.

On-Site Construction Equipment Noise

The construction activities for the proposed project are anticipated to occur over an approximately 20-month period and would include intake structure improvements, removal of sediment and reconfiguration of the spreading basins. Excavation activities will take place year-round, and the spreading grounds will not be operated for the duration of the proposed project's construction. According to the project applicant, construction activities will take place five days a week between the hours of 9:00 a.m. and 5:30 p.m. on Monday through Friday, with a 30 minute lunch break, for a total workday of 8 hours. Section 41.40(a) of the City of Los Angeles Municipal Code exempts construction activities from the City's noise standards provided construction activities do not take place between the hours of 9:00 p.m. and 7:00 a.m. Therefore, the County's planned construction hours are more restrictive than the City's requirements, and would, therefore, not expose persons to or generate noise levels in excess of standards established in the City of Los Angeles General Plan or Noise Ordinance. Impacts would be less than significant.

Off-Site Vehicular Noise

The proposed project would require the removal of 1.37 million cubic yard of sediment from the project site that would generate up to 478 daily trips from 14 cubic yard haul trucks and up to 18 daily trips from workers commuting to the project site. The haul trucks would export the material from the project site to either Boulevard Pit, Sheldon Pit, and/or Cal-Mat Pit, and Sunshine Canyon Landfill.

Vehicle noise is a combination of the noise produced by the engine, exhaust and tires. The level of traffic noise depends on three primary factors (1) the volume of traffic, (2) the speed of traffic, and (3) the number of trucks in the flow of traffic. The proposed project would alter both the volume of traffic and number of trucks on each road segment, however no changes in vehicle speed are anticipated from implementation of the proposed project.

The California Department of Health has developed the noise compatibility matrix, shown in Figure 3 on page 16, that has been adopted by most of the jurisdictions that may be impacted by the proposed project's vehicular noise and details normally acceptable noise levels for different land uses that include 60 dB CNEL for single-family homes, 65 dB CNEL for motels, and 70 dB CNEL for schools, hospitals, churches and parks. Neither the California Department of Health nor any of the local jurisdictions provide any direction for sensitive receptors that already exceed the normally acceptable noise levels for the Without Project condition, however the (Federal Transit Administration, 2006), which assesses noise and vibration impacts from transit projects found that when the ambient noise is between 60 and 64, a noise exposure increase of 2 dB is allowed before a significant impact would occur, when the ambient noise is between 65 and 74 dB CNEL, a noise exposure increase of 1 dB is allowed before a significant impact would occur and when the ambient noise exceeds 74 dB CNEL, any increase in noise exposure would create a significant impact.

The potential offsite traffic noise impacts created by project implementation project have been analyzed through utilization of the FHWA model and parameters described above in Section 6.2 and the FHWA model noise calculation spreadsheets are provided in Appendix C. The proposed project's offsite traffic noise impacts have been analyzed for Alternative Routes 1 through 4 conditions that are discussed below.

Alternative Route 1 Conditions

Alternative Route 1, would consist of concurrent use of all four disposal sites. The potential offsite noise impacts have been calculated through a comparison of the Existing scenario to the Existing Plus Alternative Route 1 scenario. The results of this comparison are shown on the following page in Table I.

Table I – Alternative Route 1 Project Traffic Noise Contributions

		dBA CNEL at Nearest Receptor[1]				Exceeds
Roadway	Segment	Existing	Existing Plus Alternative 1	Project Contribution	Threshold	Threshold ?
Arleta Avenue	North of Devonshire Street[2]	59.0	59.8	0.8	70 dBA	No

Table I shows that for the Alternative Route 1 conditions, the proposed project's noise increases to the nearby sensitive receptors from the generation of additional vehicular traffic would not exceed the increase thresholds detailed above. Furthermore, the proposed project would not cause the noise level at any nearby land use to exceed the normally compatible noise standard for the with project condition that did not already exceed the standards for the without project condition. Roadway noise impacts would be less than significant for Alternative Route 1.

Alternative Route 2 Conditions

Alternative Route 2, would consist of use of Boulevard Pit only. The potential offsite noise impacts have been calculated through a comparison of the Existing scenario to the Existing Plus Alternative Route 2 scenario. The results of this comparison are shown in Table J.

Table J – Alternative Route 2 Project Traffic Noise Contributions

Roadway	Segment	dBA CNEL at Nearest Receptor[1] Existing	Existing Plus Alternative 2	Project Contribution	Threshold	Exceeds Threshold ?
Arleta Avenue	North of Devonshire Street[2]	59.0	59.8	0.8	70 dBA	No
Arleta Avenue	East of Devonshire Street[3]	66.8	67.5	0.7	+1 dBA	No

Table J shows that for the Alternative Route 2 conditions, the proposed project's noise increases to the nearby sensitive receptors from the generation of additional vehicular traffic would not exceed the increase thresholds detailed above. Furthermore, the proposed project would not cause the noise level at any nearby land use to exceed the normally compatible noise standard for the with project condition that did not already exceed the standards for the without project condition. Roadway noise impacts would be less than significant for Alternative Route 2.

Alternative Route 3 Conditions

Alternative Route 3, would consist of use of Sheldon Pit only. The potential offsite noise impacts have been calculated through a comparison of the Existing scenario to the Existing Plus Alternative Route 3 scenario. The results of this comparison are shown in Table K.

Table K – Alternative Route 3 Project Traffic Noise Contributions

Roadway	Segment	dBA CNEL at Nearest Receptor[1] Existing	Existing Plus Alternative 3	Project Contribution	Threshold	Exceeds Threshold ?
Arleta Avenue	North of Devonshire Street[2]	59.1	59.8	0.7	70 dBA	No

[6] Nearest sensitive receptor is a motel.
Source: FHWA Traffic Noise Prediction Model FHWA-RD-77-108.

Table K shows that for the Alternative Route 3 conditions, the proposed project's noise increases to the nearby sensitive receptors from the generation of additional vehicular traffic would not exceed the increase thresholds detailed above. Furthermore, the proposed project would not cause the noise level at any nearby land use to exceed the normally compatible noise standard for the with project condition that did not already exceed the standards for the without project condition. Roadway noise impacts would be less than significant for Alternative Route 3.

Alternative Route 4 Conditions

Alternative Route 4, would consist of use of Cal-Mat Pit only. The potential offsite noise impacts have been calculated through a comparison of the Existing scenario to the Existing Plus Alternative Route 4 scenario. The results of this comparison are shown in Table L.

Table L – Alternative Route 4 Project Traffic Noise Contributions

Roadway	Segment	dBA CNEL at Nearest Receptor[1]			Threshold	Exceeds Threshold ?
		Existing	Existing Plus Alternative 4	Project Contribution		
Arleta Avenue	North of Devonshire Street[2]	59.0	59.8	0.8	70 dBA	No
Arleta Avenue	East of Devonshire Street[3]	66.8	67.5	0.7	+1 dBA	No

Osborne Street	North of Glen Oaks Boulevard[3]	68.5	69.2	0.7	+1 dBA	No
Osborne Street	North of Dronfield Avenue[3]	65.4	66.1	0.7	+1 dBA	No
Foothill Boulevard	East of Osborne Street[3]	63.7	64.2	0.5	+2 dBA	No
Foothill Boulevard	West of I-210 Westbound Ramps[3]	60.0	60.5	0.5	+2 dBA	No
Roxford Street	South of I-5 Northbound Ramps[3]	57.7	58.7	1.0	60 dBA	No
San Fernando Road	East of Sunshine Canyon Road[3]	66.7	67.0	0.3	+1 dBA	No

Notes:
[1] Distance to nearest receptor shown in Table E, does not take into account existing noise barriers.
[2] Nearest sensitive receptor is a park.
[3] Nearest sensitive receptor is residential
[4] Nearest sensitive receptor is a school.
[5] Nearest sensitive receptor is a hospital.
[6] Nearest sensitive receptor is a motel.
Source: FHWA Traffic Noise Prediction Model FHWA-RD-77-108.

Table L shows that for the Alternative Route 4 conditions, the proposed project's noise increases to the nearby sensitive receptors from the generation of additional vehicular traffic would not exceed the increase thresholds detailed above. Furthermore, the proposed project would not cause the noise level at any nearby land use to exceed the normally compatible noise standard for the with project condition that did not already exceed the standards for the without project condition. Roadway noise impacts would be less than significant for Alternative Route 4.

Operation-Related Noise

The on-going operation of the proposed project would not result in a long-term increase in noise impacts. Currently, the project site requires occasional periodic visits from LACFCD staff and result in noise impacts from the vehicle transporting the workers to and from the project site. Implementation of the proposed project would not result in any additional site visits from LACFCD staff. Therefore, implementation of the proposed project would not increase operational-related noise impacts from the existing condition and would result in no impact.

Level of Significance

Less than significant impact during construction, no impact during operation.

7.3 Generation of Excessive Groundborne Vibration

The proposed project would not expose persons to or generation of excessive groundborne vibration or groundborne noise levels. The following section analyzes the potential vibration impacts associated with the construction and operation of the proposed project.

Construction-Related Vibration Impacts

The construction activities for the proposed project are anticipated to include intake structure improvements, removal of sediment and reconfiguration of the spreading basins and the proposed improvements are anticipated to require the use of bulldozers, hoe rams (for concrete demolition), excavators, water trucks, a street sweeper, and dump trucks. The nearest sensitive receptors of vibration impacts to the project site are single-family homes as near as 35 feet southwest of the proposed improvements to the spreading grounds.

Since neither the City of Los Angeles General Plan or Municipal Code provide any vibration standards for construction activities, Caltrans guidance that is detailed in Section 4.2 has been utilized, which defines the threshold of perception from transient sources at 0.25 inch per second PPV.

The primary source of vibration during construction would be from the operation of bulldozers utilized in the spreading grounds and demolition of the headworks and from hoe rams utilized during demolition of the headworks. From Table H above, both large bulldozers and hoe rams would create a vibration level of 0.089 inch per second PPV at 25 feet. Based on typical propagation rates, the vibration level at the nearest offsite receptors (single-family homes located southwest of the spreading grounds) would be 0.061 inch per second PPV. The vibration level at the nearest vibration sensitive offsite receptor would be within the 0.25 inch per second PPV threshold detailed above. Therefore, a less than significant vibration impact is anticipated from construction of the proposed project.

Operation-Related Vibration Impacts

The on-going operation of the proposed project would not result in an increase in operations related vibration impacts. Currently, the project site requires annual maintenance including the use of bulldozers within the spreading basins. The annual maintenance at the project site will not increase as a result of the proposed project. Therefore, no vibration impact is anticipated from the operation of the proposed project.

Level of Significance

Less than significant impact during construction, no impact during operation.

7.4 Permanent Substantial Noise Level Increase

The ongoing operation of the proposed project would not result in a substantial permanent increase in ambient noise levels in the project vicinity above existing levels without the proposed project. As detailed in Section 7.3, the project site currently requires occasional periodic visits from LACDPW staff and result in noise impacts from the vehicle transporting the workers to and from the project site. Implementation of the proposed project would not result in any additional site visits from LACFCD staff. Therefore, the proposed project would not result in a substantial permanent increase in ambient noise levels and there would be no impact.

Level of Significance

No impact.

7.5 Temporary Substantial Noise Level Increase

Noise impacts from construction activities associated with the proposed project would be a function of the noise generated by construction equipment, equipment location, sensitivity of nearby land uses, and the timing and duration of the construction activities. The proposed project may create a substantial temporary or periodic increase in ambient noise levels in the project vicinity above noise levels existing without the proposed project.

The construction activities for the proposed project are anticipated to require the use of two bulldozers, two excavators, three water trucks, a street sweeper, and 11 dump trucks; however, no more than four dump trucks are anticipated to be operating on the project site at any one time. In addition, a mounted impact hammer would be used on an excavator to demolish the existing diversion channel intake system. The nearest sensitive receptors to the project site have been detailed above in Section 1.4, which found the nearest sensitive receptors to the spreading basin are single-family homes and a church as near as 35 feet from the proposed improvements to Basin 6 and Devonwood Park located as near as 30 feet west of the proposed improvements to Basin 6. Since the construction equipment utilized on the diversion channel demolition would be different than what would be utilized on the spreading basin improvements, the nearest home to the diversion channel has also been analyzed.

Section 41.40(a) of the City of Los Angeles Municipal Code exempts construction activities from the City's noise standards provided construction activities do not take place between the hours of 9:00 p.m. and 7:00 a.m. The analysis above in Section 7.2 found that the proposed project would conform to, and be more restrictive than, the City construction hour limits. However, the City Municipal Code does not provide quantitative limits to the noise levels that may be created from construction activities. Even with adherence to the City standards for construction hours, the resultant construction noise levels may result in a significant substantial temporary noise increase to the nearby offsite receptors.

In order to determine if the proposed construction activities would create a significant substantial temporary noise increase, the FTA construction noise criteria thresholds detailed above in Section 4.1 have been utilized. The FTA construction daytime noise thresholds limits noise exposure to the nearby homes to 80 dB or less over eight continuous hours or 90 dB or less over one continuous hour and this standard has been utilized to analyze the construction noise impacts to all of the offsite receptors. According to the project applicant, construction activities at the spreading basins would consist of the use of bulldozers and excavators that would be constantly moving and would result in activities occurring near any nearby sensitive receptor limited to less than one hour intervals and therefore the 1-hour construction noise threshold was utilized for the receptors next to the Spreading Basin. The demolition activities at the Diversion Channel would require the use of excavators with mounted impact hammers or hoe rams to break up the existing concrete and the demolition activities would have the potential of

occurring in the same general proximity for 8-hour durations and therefore the 8-hour construction noise threshold was utilized for the receptor next to the diversion channel. The results are shown below in Table M and the RCNM printouts are provided in Appendix B.

Table M – Unmitigated Worst-Case Construction Noise Levels at Nearest Property Lines

Sensitive Receptor	Distance to Receptor (feet)	Construction Noise Level (dBA Leq)	Threshold[1] (dBA Leq)	Exceed Threshold?
Devonwood Park	30	83	90	No
Nearest Home and Church to Spreading Basin	35	82	90	No
Nearest Home to Diversion Channel	40	86	80	**Yes**

Notes:
[1] Threshold for spreading basin activities based on FTA 1-hour daytime standard of 90 dBA Leq and threshold for Diversion Channel activities based on FTA 8-hour daytime standard of 80 dBA Leq.
Source: RCNM, Federal Highway Administration, 2006

Table M shows that greatest noise impacts would occur at the nearest homes to the Diversion Channel demolition activities, with a noise level as high as 86 dBA Leq at the nearest offsite residential use. Table M shows that the noise levels from Diversion Channel demolition activities would exceed the 80 dB 8-hour threshold detailed above. This would be considered a significant impact.

Mitigation Measure 1 is provided that would require the County of Los Angeles Department of Public Works to install an 8-foot high temporary sound wall along the shared property line with the nearby homes located northwest of the Diversion Channel Improvements. The temporary sound wall shall extend a minimum of 100 feet past the extent of the Diversion Channel demolition activities and shall be constructed of minimum ½-inch plywood or OSB. The temporary sound wall shall be installed prior to the start of demolition activities and shall remain until the completion of the Diversion Channel improvements.

The 8-foot height was utilized, since that is the height required to break the line-of-sight between the proposed construction equipment and a person standing in the backyard in the nearby homes. According to Caltrans *Technical Noise Supplement*, November 2009, a sound wall that is tall enough to break the line-of-sight between the proposed equipment and receiver would provide approximately 7 dB of noise reduction. This would result in a noise level of 79 dBA Leq at the nearest homes to the Diversion Channel demolition activities and would be within the 80 dBA Leq 8-hour standard for noise sources that would occur in the same location for 8-hours. It should also be noted that most of the demolition work would occur with the equipment located inside the intake canal, that is located as much as 20 feet below the grade of the surrounding receptors and this additional grade difference would provide additional sound attenuation. Therefore, with implementation of Mitigation Measure 1, a less than significant construction noise impact would occur from development of the proposed project.

Level of Significance Before Mitigation

Potentially significant impact.

Mitigation Measures

Mitigation Measure 1:

The County of Los Angeles Department of Public Works shall construct a 8-foot high temporary sound wall along the shared property line with the nearby homes located northwest of the Diversion Channel Improvements. The temporary sound wall shall extend a minimum of 100 feet past the extent of the Diversion Channel demolition activities and shall be constructed of

minimum ½-inch plywood or OSB. The temporary sound wall shall be installed prior to the start of demolition activities and shall remain until the completion of the Diversion Channel improvements.

Level of Significance After Mitigation

Less than significant impact.

7.6 Aircraft Noise

The proposed project would not expose people residing or working in the project area to excessive noise levels from aircraft. The nearest airport is Whiteman Airport, located approximately 1.5 mile east of the project site. The project site is located outside of the 65 dBA CNEL noise contours of any airport and the site observations during the noise measurements determined that aircraft create minimal noise impacts at the project site. Furthermore, the proposed project would not introduce any new sensitive receptors to the project site or surrounding area. No aircraft noise impact would occur from implementation of the proposed project.

Level of Significance

No impact.

General Information

Serial Number	02509
Model	831
Firmware Version	2.112
Filename	831_Data.004
User	GT
Job Description	Pacoima Spreading Grounds Improvements Project
Location	At Sun Valley HS 50' SE of Sheldon St CL + 100' SW of Telfair Av

Measurement Description	
Start Time	Tuesday, 2014 August 19 13:50:02
Stop Time	Tuesday, 2014 August 19 14:03:03
Duration	00:13:00.5
Run Time	00:13:00.5
Pause	00:00:00.0
Pre Calibration	Tuesday, 2014 August 19 12:15:52
Post Calibration	None
Calibration Deviation	---

Note

Noise primarily from Sheldon St, Telfair Av and children
81 F, 28.90 in Hg, 35% Hu. 2 mph wind, partly cloudy
